# Astronomy 1X

Session 2006-07

## *Solar System Physics I*

Dr Martin Hendry

6 lectures, beginning Autumn 2006

# Dr Martin Hendry

- **Room 607, Kelvin Building**
- **email: [martin@astro.gla.ac.uk](mailto:martin@astro.gla.ac.uk)**
- **Tel: ext 5685**
- **Office hours: no formal time**

Course webpages: access via [A1X moodle site](#)

<http://moodle.gla.ac.uk/physics/moodle/>

# ASTRONOMY TODAY

FIFTH EDITION  
CHAISSON • McMILLAN

Course Textbook available as a **special package** from the University Bookshop:

*Includes additional chapters from Carroll & Ostlie which are **essential** to A1X,Y*

*Cost*

£49.99

Includes access to online learning resources for Astronomy Today

# Astronomy A1X 2006-07

## Solar System Physics I - Lecture Plan

### **Introductory Tour of the Solar System**

**1 lecture**

- o Qualitative description of the Sun, planets, moons and minor bodies, contrasting Jovian and terrestrial planets
- o Vital statistics
- o Overview of Solar System formation

### **Gravitation and Solar System physics**

**1.5 lectures**

- o Newton's law of gravitation and link to A1X Dynamical Astronomy
- o Surface gravity and escape velocity
- o Tidal forces

# Astronomy A1X 2006-07

## Solar System Physics I - Lecture Plan

### **The physics of planetary atmospheres** **1.5 lectures**

- o The ideal gas law and velocity of gases
- o Hydrostatic equilibrium and atmospheric scale heights

### **The Jovian planets and their moons** **2 lectures**

- o Internal and atmospheric structure and composition
- o Ring systems and Roche stability
- o Physical properties of the main satellites
- o Case studies: Titan and the Galilean moons

# Lecture 1: A Tour of the Solar System

Some vital statistics:-

The Solar System consists of:-

- the Sun,
  - its **8** planets,
  - their moons,
  - dwarf planets, asteroids and comets,
  - the 'Solar wind'
- 
- Astronomers have studied the motions of the Sun, Moon and planets for thousands of years (see A1X Positional Astronomy).

# Retrograde motion

# Lecture 1: A Tour of the Solar System

Some vital statistics:-

The Solar System consists of:-

- the Sun,
  - its **8** planets,
  - their moons,
  - dwarf planets, asteroids and comets,
  - the 'Solar wind'
- 
- Astronomers have studied the motions of the Sun, Moon and planets for thousands of years (see A1X Positional Astronomy).
  - Before the invention of the telescope, however, we knew almost nothing about their true nature

# The Observations of Galileo

Galileo Galilei:  
(1564 - 1642)

# The Observations of Galileo

In 1609 observed phases of Venus

Geocentric model

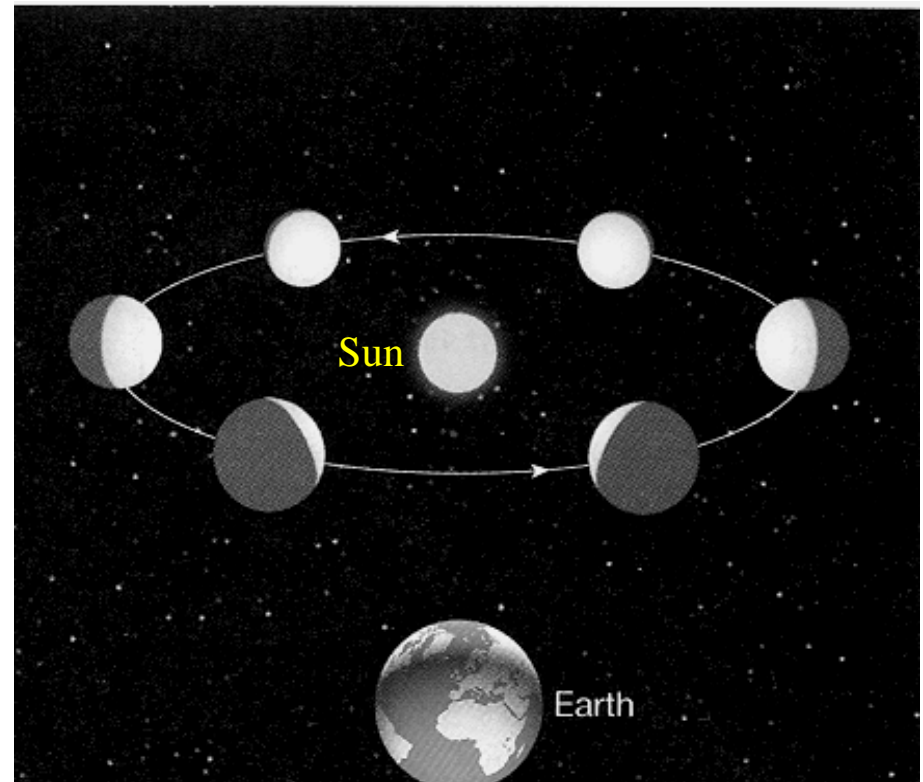

# The Observations of Galileo

In 1609 observed phases of Venus

Geocentric model

Heliocentric model

# The Observations of Galileo

Phases of Venus  
impossible to explain  
in geocentric model

Clear evidence  
that the Earth  
went round the  
Sun, and not the  
other way round

# Lecture 1: A Tour of the Solar System

The Sun: some vital statistics:-

The Sun is a **star**: a ball of (mainly) hydrogen gas,  
700,000 km in radius (about 100 Earth radii)

Earth, to scale

# Lecture 1: A Tour of the Solar System

The Sun: some vital statistics:-

The Sun is a **star**: a ball of (mainly) hydrogen gas, 700,000 km in radius (about 100 Earth radii)

It generates heat and light through **nuclear fusion**:

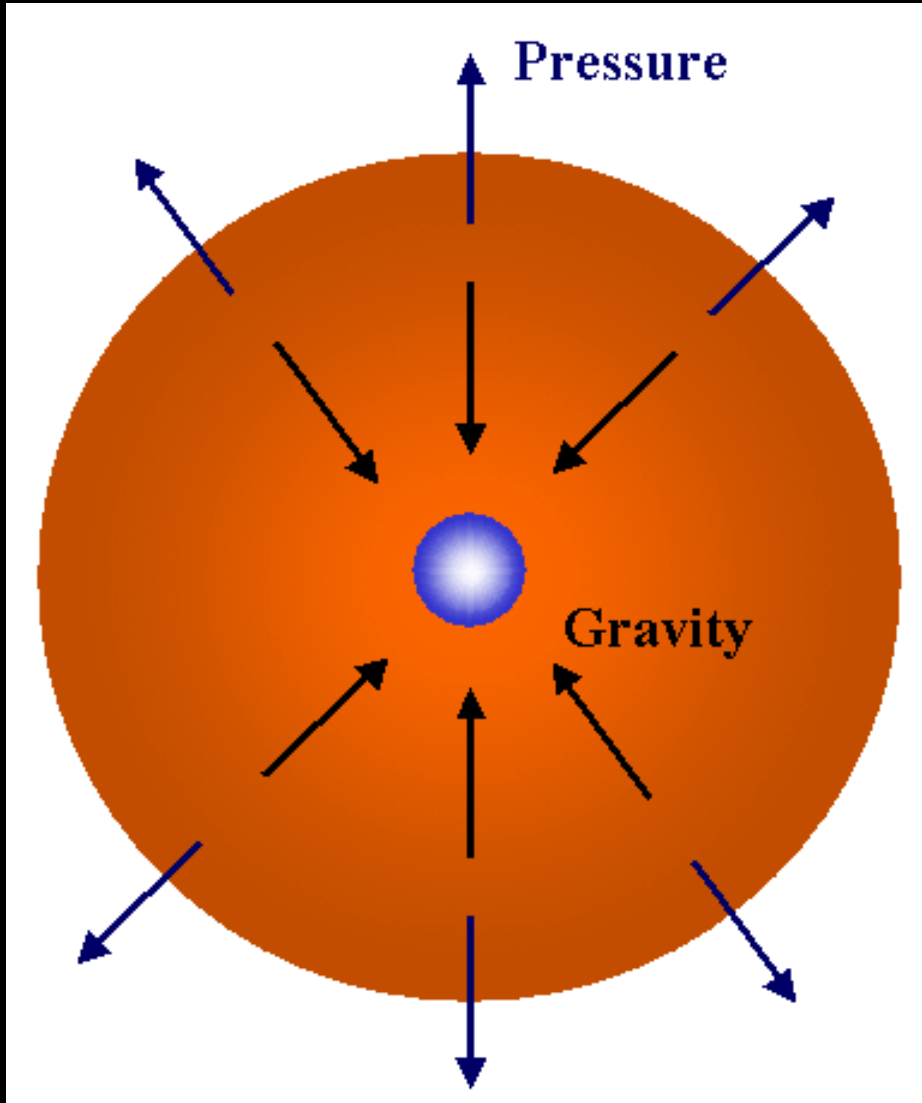

Surface temperature = 5800K

Central temperature = 15 million K

Balance (hydrostatic equilibrium) maintained between *pressure* and *gravity*

# Hydrogen fusion - fuelling a star's nuclear furnace

$$E = mc^2$$

# Lecture 1: A Tour of the Solar System

The Sun: some vital statistics:-

The Sun is a **star**: a ball of (mainly) hydrogen gas, 700,000 km in radius (about 100 Earth radii)

It generates heat and light through **nuclear fusion**:

Surface temperature = 5800K

Central temperature = 15 million K

Balance (hydrostatic equilibrium) maintained between *pressure* and *gravity*

The Sun's outer atmosphere, or **corona**, is very hot (several million K) - heated by twisting of the Sun's magnetic field?...

Earth's magnetic field

Magnetic fields on the sun

Approximate size  
of earth for  
comparison

# Lecture 1: A Tour of the Solar System

The Planets: some vital statistics:-

Name	Diameter* (Earth=1)	Mass (Earth=1)	Mean distance from the Sun
Mercury	4880 km (0.383)	$3.302 \times 10^{23}$ kg (0.055)	$5.79 \times 10^7$ km (0.387 AU)
Venus	12104 km (0.949)	$4.869 \times 10^{24}$ kg (0.815)	$1.082 \times 10^8$ km (0.723 AU)
Earth	12756 km (1.000)	$5.974 \times 10^{24}$ kg (1.000)	$1.496 \times 10^8$ km (1.000 AU)
Mars	6794 km (0.533)	$6.418 \times 10^{23}$ kg (0.107)	$2.279 \times 10^8$ km (1.524 AU)
Jupiter	142984 km (11.209)	$1.899 \times 10^{27}$ kg (317.8)	$7.783 \times 10^8$ km (5.203 AU)
Saturn	120536 km (9.449)	$5.685 \times 10^{26}$ kg (95.16)	$1.432 \times 10^9$ km (9.572 AU)
Uranus	51118 km (4.007)	$8.682 \times 10^{25}$ kg (14.53)	$2.871 \times 10^9$ km (19.194 AU)
Neptune	49528 km (3.883)	$1.024 \times 10^{26}$ kg (17.15)	$4.498 \times 10^9$ km (30.066 AU)
Pluto	~2300 km (0.18)	$1.3 \times 10^{22}$ kg (0.0021)	$5.915 \times 10^9$ km (39.537 AU)

\* Equatorial diameter

# Lecture 1: A Tour of the Solar System

Mean Earth - Sun distance = **Astronomical Unit**

**149,597,870 km**

1 A.U. = 107 solar diameters

# May 7<sup>th</sup> 2003: Transit of Mercury

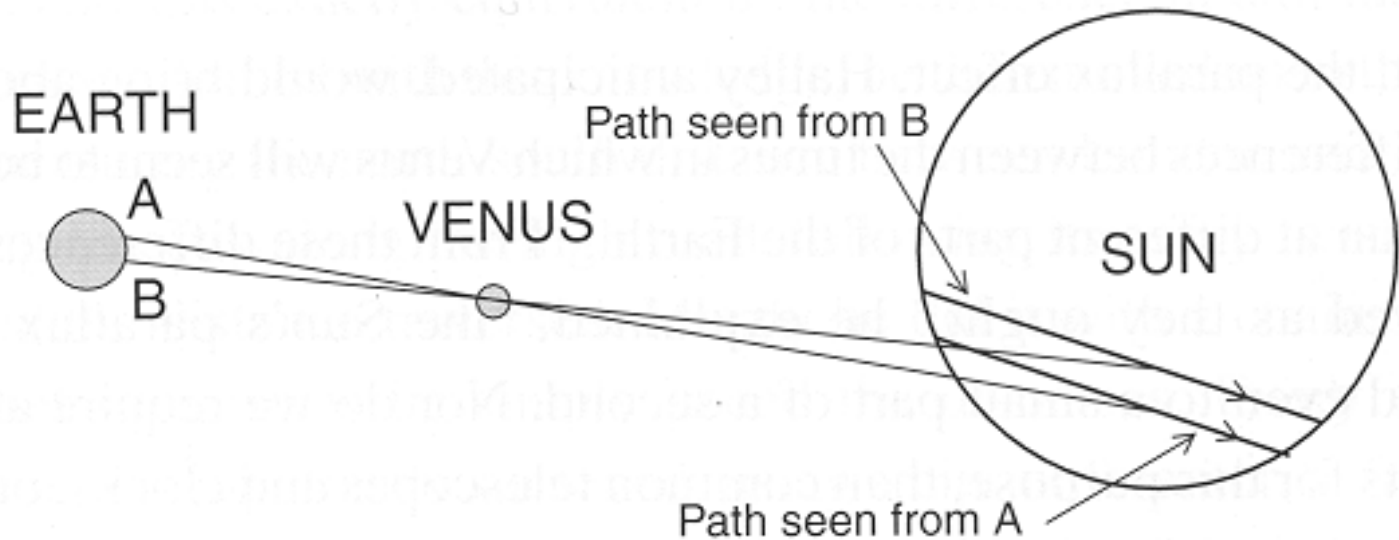

Edmond Halley  
(1656 - 1742)

In 1716 Halley presented a paper, appealing to astronomers around the world to observe the Venus transits of 1761 and 1769

He predicted the astronomical unit could be measured to an accuracy of better than 1%

Local Time: 09/08/2004 AD 05:00  
Location: Stay on surface of Earth  
Lon = 004° 18' W Lat = 55° 54' N  
View: Lock on Sun  
Azim = 061° 47' 30" Alt = +08° 48' 36"

NASA's first  
mission capable  
of finding Earth-size  
and smaller planets

**Kepler mission**  
**(launch 2008?)**

# Lecture 1: A Tour of the Solar System

Mean Earth - Sun distance = **Astronomical Unit**

**149,597,870 km**

1 A.U. = 107 solar diameters

The orbits of the planets are **ellipses** (see A1X Dynamical Astronomy) and lie in, or close to, a plane - the **ecliptic**.

# Lecture 1: A Tour of the Solar System

Mean Earth - Sun distance = **Astronomical Unit**

**149,597,870 km**

1 A.U. = 107 solar diameters

The orbits of the planets are **ellipses** (see A1X Dynamical Astronomy) and lie in, or close to, a plane - the **ecliptic**.

The planets divide into two groups:-

Inner *Terrestrial* planets: small, rocky

Mercury, Venus, Earth, Mars

Outer *Jovian* planets: gas giants

Jupiter, Saturn, Uranus, Neptune

# Venus Vital Statistics:

Surface temperature 450K

Atmosphere ~100% CO<sub>2</sub>

Pressure 90 times Earth's

Sulphuric Acid Rain

Thick crust: regular  
volcanic 'resurfacing'

Formation of the Moon:  
Impact from Mars-sized  
planetesimal during first  
billion years.

Impact energy = 1 million million megatons

Acidalia

Tharsis

Elysium

Syrtis Major

# Mars 2004:

- Mars Express ( + Beagle 2)
- Spirit + Opportunity

Jan 23<sup>rd</sup> 2004:

Mars Express  
Orbiter detects  
water ice at the  
South Pole of Mars.
