

Extreme Astrophysics

Dr Martin Hendry
Dept of Physics and Astronomy

UNIVERSITY
of
GLASGOW

**Extreme
astrophysics:
Jan 2007**

Extreme Astrophysics

Provisional schedule

22/01	Introduction / Life and death of stars / supernovae	M. Hendry
29/01		
05/02	The search for gravitational waves	M. Pitkin
12/02	The story of cosmic rays	A. Mackinnon
19/02	The threat of asteroid impact	B. Steves
26/02	Gamma ray bursts	F. Speirits
05/03	A recipe for galaxy formation	L. Teodoro /
12/03	Echoes of the Big Bang	M. Hendry
19/03	Welcome to quantum gravity!	N. Gray / M. Hendry

Also: 03/02 Transits and Eclipses Day School

UNIVERSITY

GLASGOW

**Extreme
astrophysics:
Jan 2007**

We can extend our 'map' of the Universe downwards to sub-atomic scales.

See e.g. wikipedia

[http://en.wikipedia.org/wiki/Orders_of_magnitude_\(length\)](http://en.wikipedia.org/wiki/Orders_of_magnitude_(length))

Other useful units:

1 Astronomical Unit = 150 million km

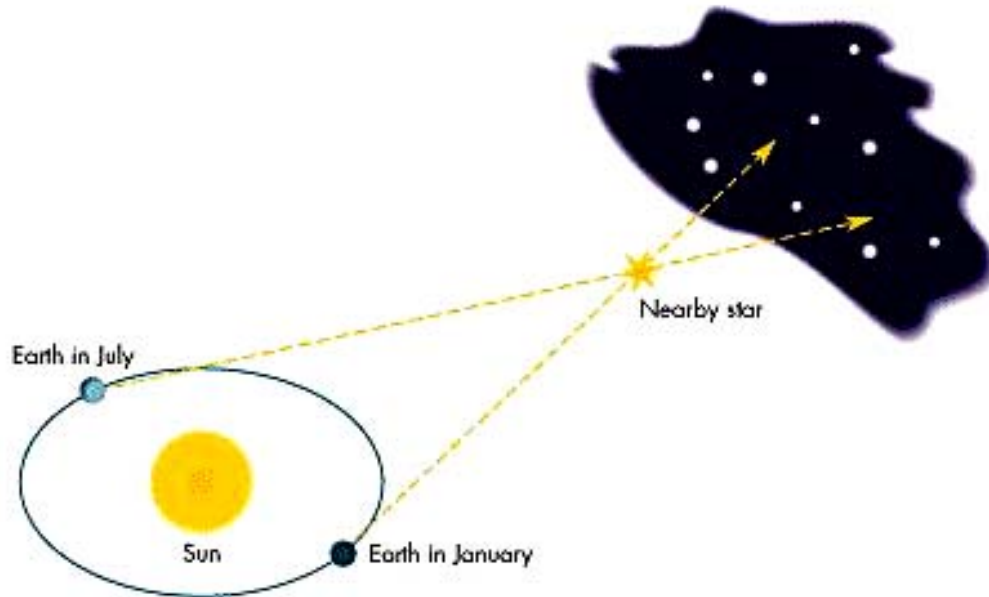

1 parsec = 3.26 light years

= 206265 AU

Measuring Astronomical Distances: Parallax

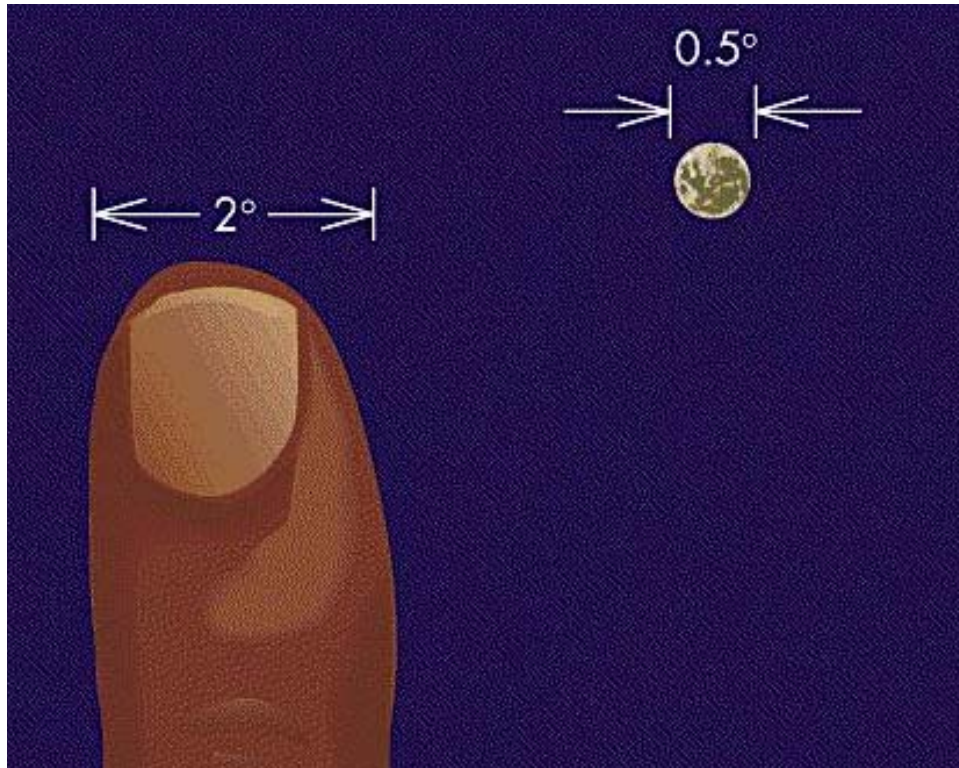

View from the Earth in January

View from the Earth in July

Measuring Astronomical Distances: Parallax

Even the nearest star shows a parallax shift of only **1/2000th** the width of the full Moon

View from the Earth in January

View from the Earth in July

The stars are VERY far away. The nearest star (after the Sun) is about 40 million million km from the Earth. It takes light more than 4 years to travel this distance.

If the distance from the Earth to the Sun were the width of this screen, the next nearest star would be in Rome.

Stars radiate equally in all directions

This gives rise to the Inverse-Square Law:

The apparent brightness of a star falls off with the square of its distance

1000w

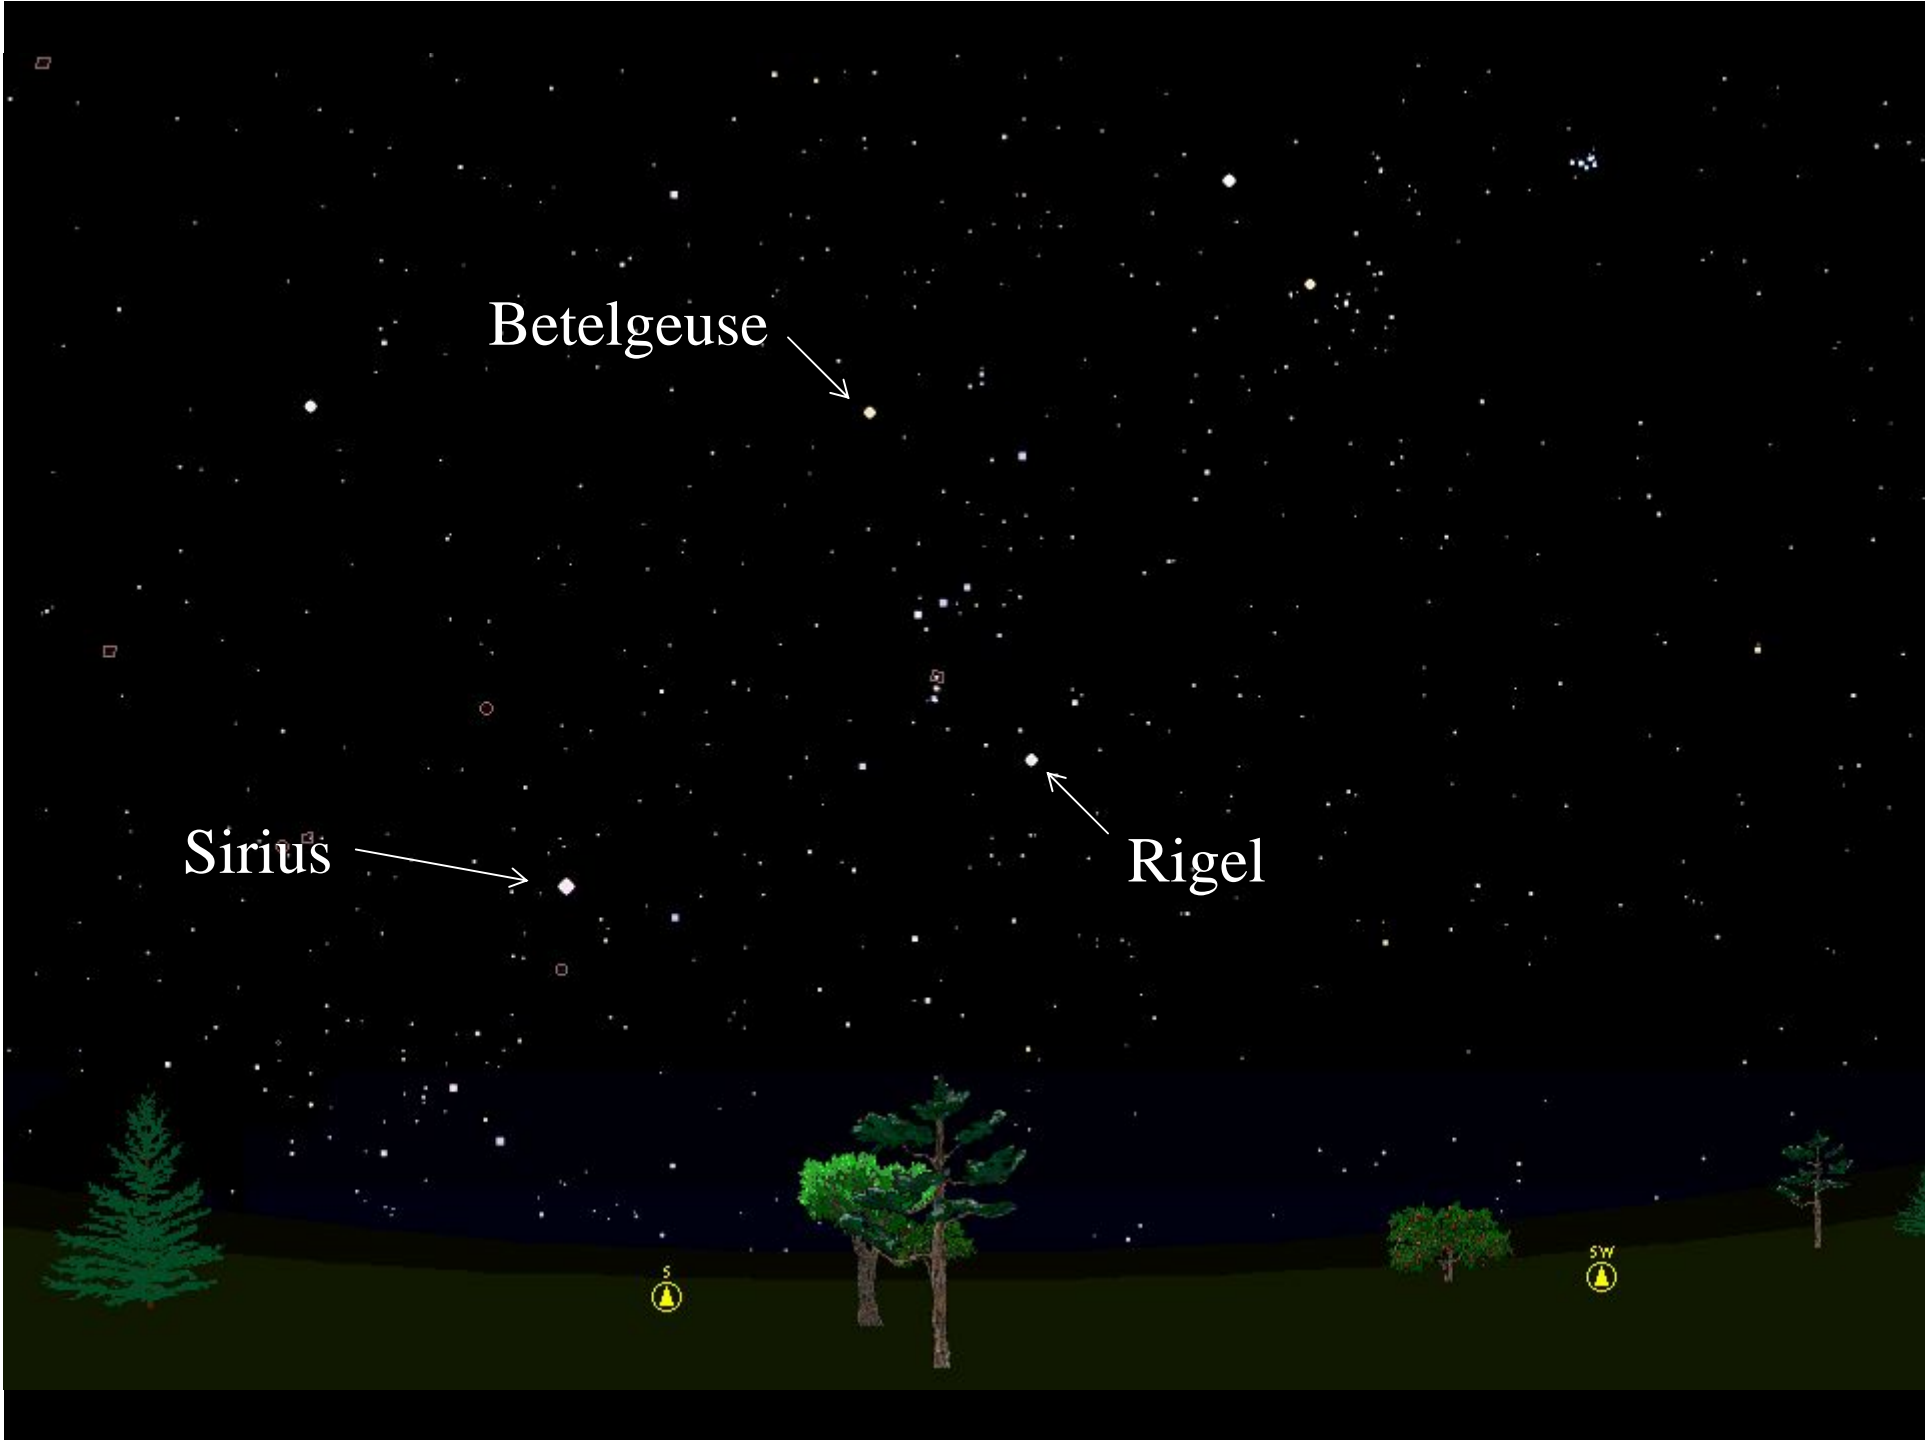

1000w

Betelgeuse

Rigel

Betelgeuse

Sirius

Rigel

S

SW

A still from a film showing two men at a table. The man on the left has grey hair and is wearing a dark sweater. He is holding a small, shiny, metallic object in his hand, showing it to the man on the right. The man on the right has brown hair and is also wearing a dark sweater. He is looking at the object with a serious expression. On the table in front of them is a glass and some small items. A speech bubble is positioned above the man with grey hair, containing the text: "These are small, while the ones out there are far away..."

“These are small, while
the ones out there are
far away...”

We measure
the intrinsic
brightness of
a star by its
luminosity

Luminosity, L (*watts*)

e.g. for the Sun

$$L = 4 \times 10^{26} \text{ W}$$

1 Watt = 1 Joule of energy per second

= power needed to lift 1 kg bag of sugar vertically about 10cm in one second

Luminosity varies with
colour (see later)

*e.g. consider Rigel and
Betelgeuse in Orion*

Luminosity varies with colour (see later)

e.g. consider Rigel and Betelgeuse in Orion

Adding up luminosity L at all colours

⇒ **Bolometric luminosity**

e.g. for the Sun

$$L_{\text{bol}} = 4 \times 10^{26} \text{ W}$$

Hydrogen fusion – fuelling a star’s nuclear furnace

$$E = mc^2$$

Speed of light

Einstein's Relativity

300,000
kms⁻¹

The speed of light is the
ultimate speed limit in
the Universe

THE ELECTROMAGNETIC SPECTRUM

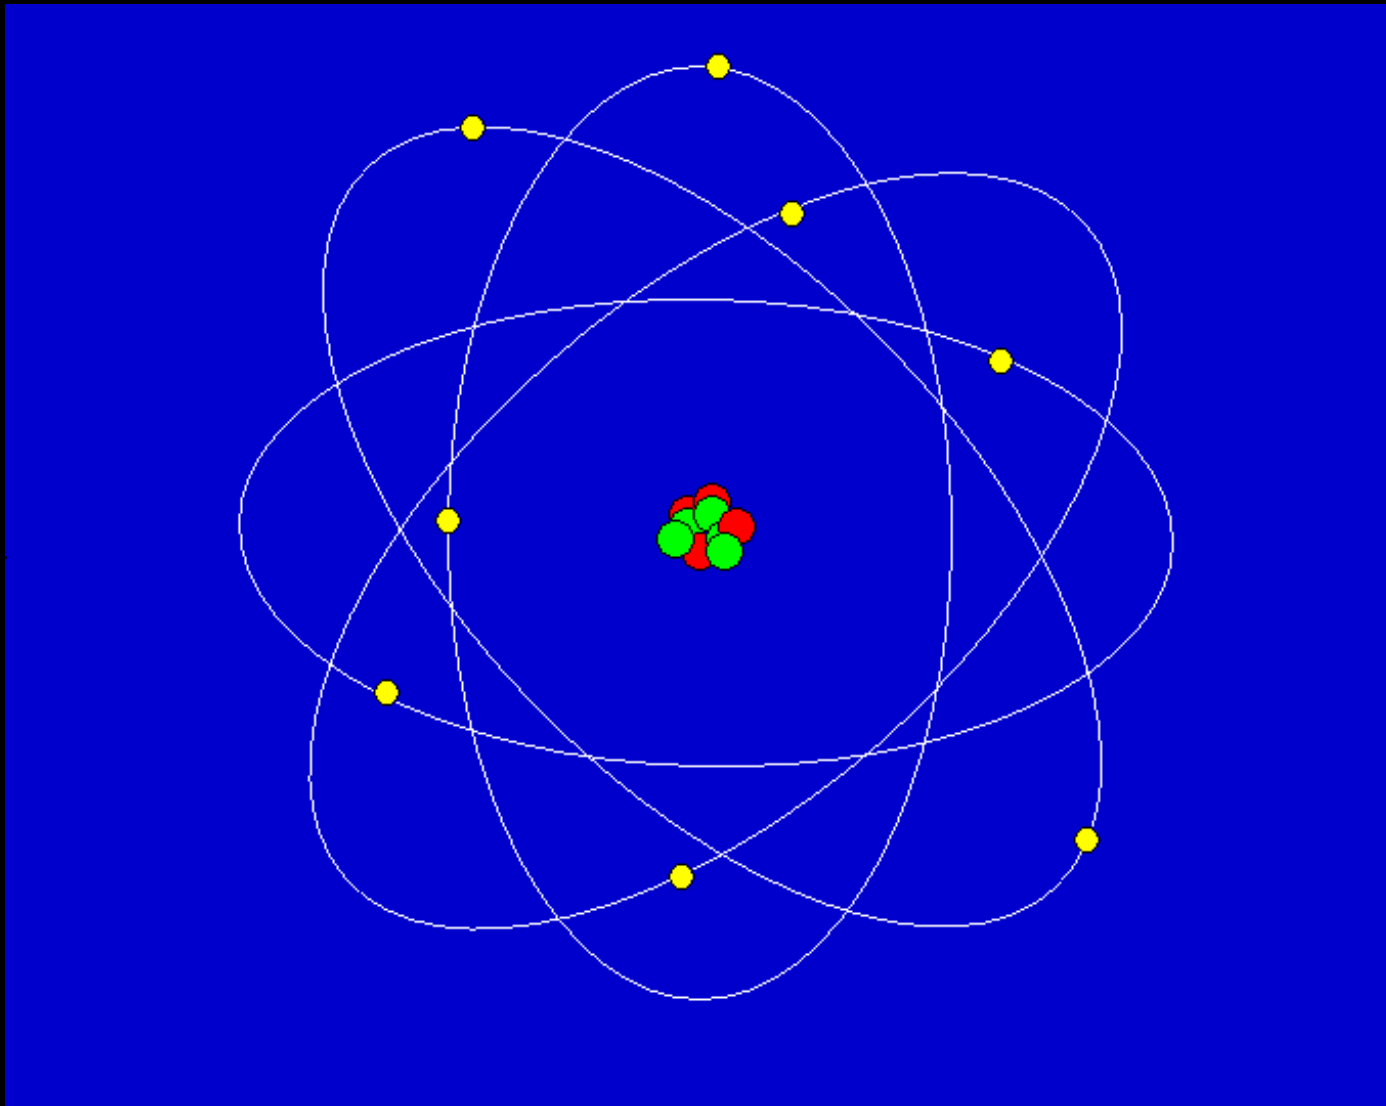

$$\text{Speed} = \text{wavelength} \times \text{frequency}$$

Maxwell's theory of light

Early 1900s: accelerated electron radiates

How do atoms persist?

Black-body radiation

Max Planck

William Thomson
(Lord Kelvin)
1824 - 1907

"In the present state of physical science, therefore, a question of extreme interest arises: Is there any principle on which an absolute thermometric scale can be founded?"

Wien's law

$$\lambda_{\text{max}} T = 2.9 \times 10^{-3}$$

in m

in K

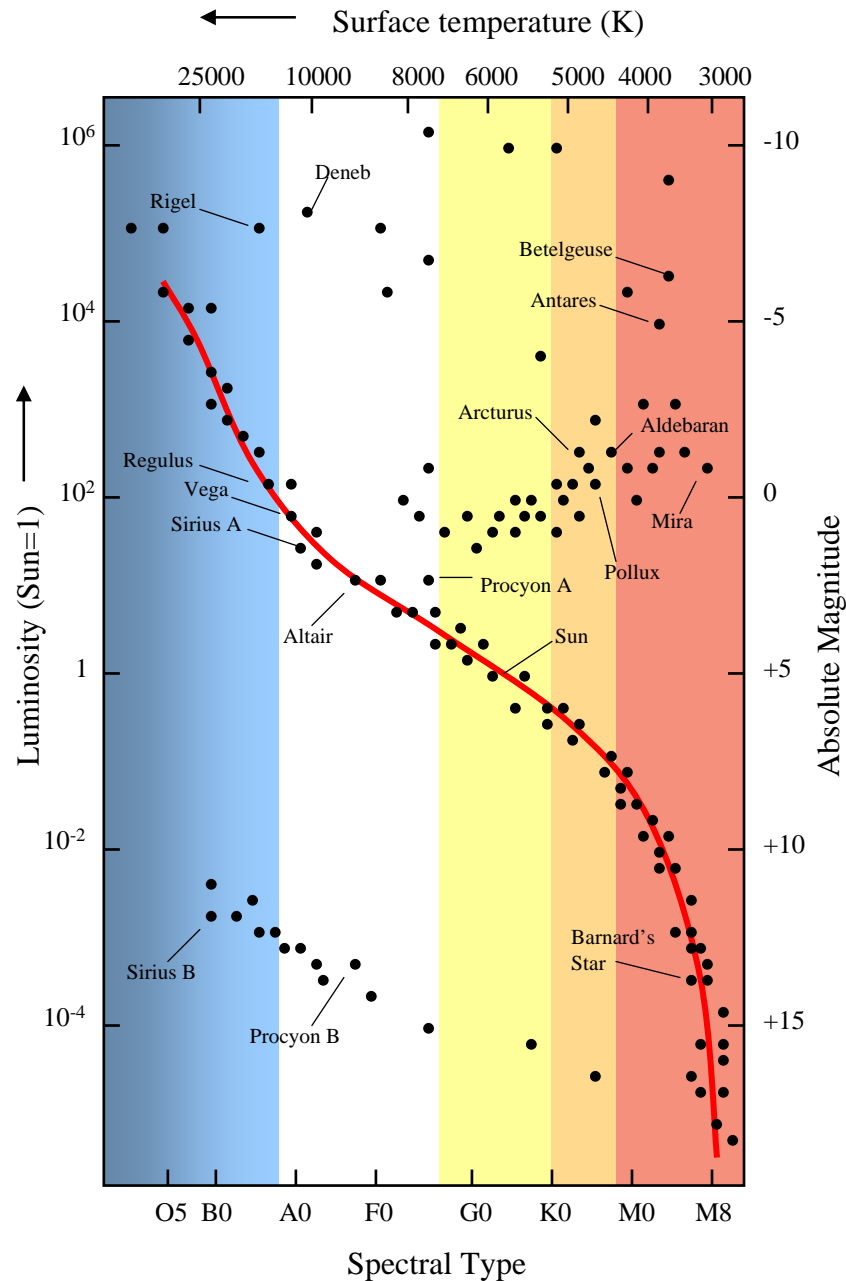

We can plot the **temperature** and **luminosity** of stars on a diagram

Stars don't appear *everywhere*: they group together, and most are found on the **Main Sequence**

Stars found on the **Main Sequence** convert hydrogen into helium.

Stars like the Sun can do this for many billions of years, using the **P-P chain** of nuclear reactions

Stars found on the **Main Sequence** convert hydrogen into helium.

Stars like the Sun can do this for many billions of years, using the **P-P chain** of nuclear reactions

Stars found on the **Main Sequence** convert hydrogen into helium.

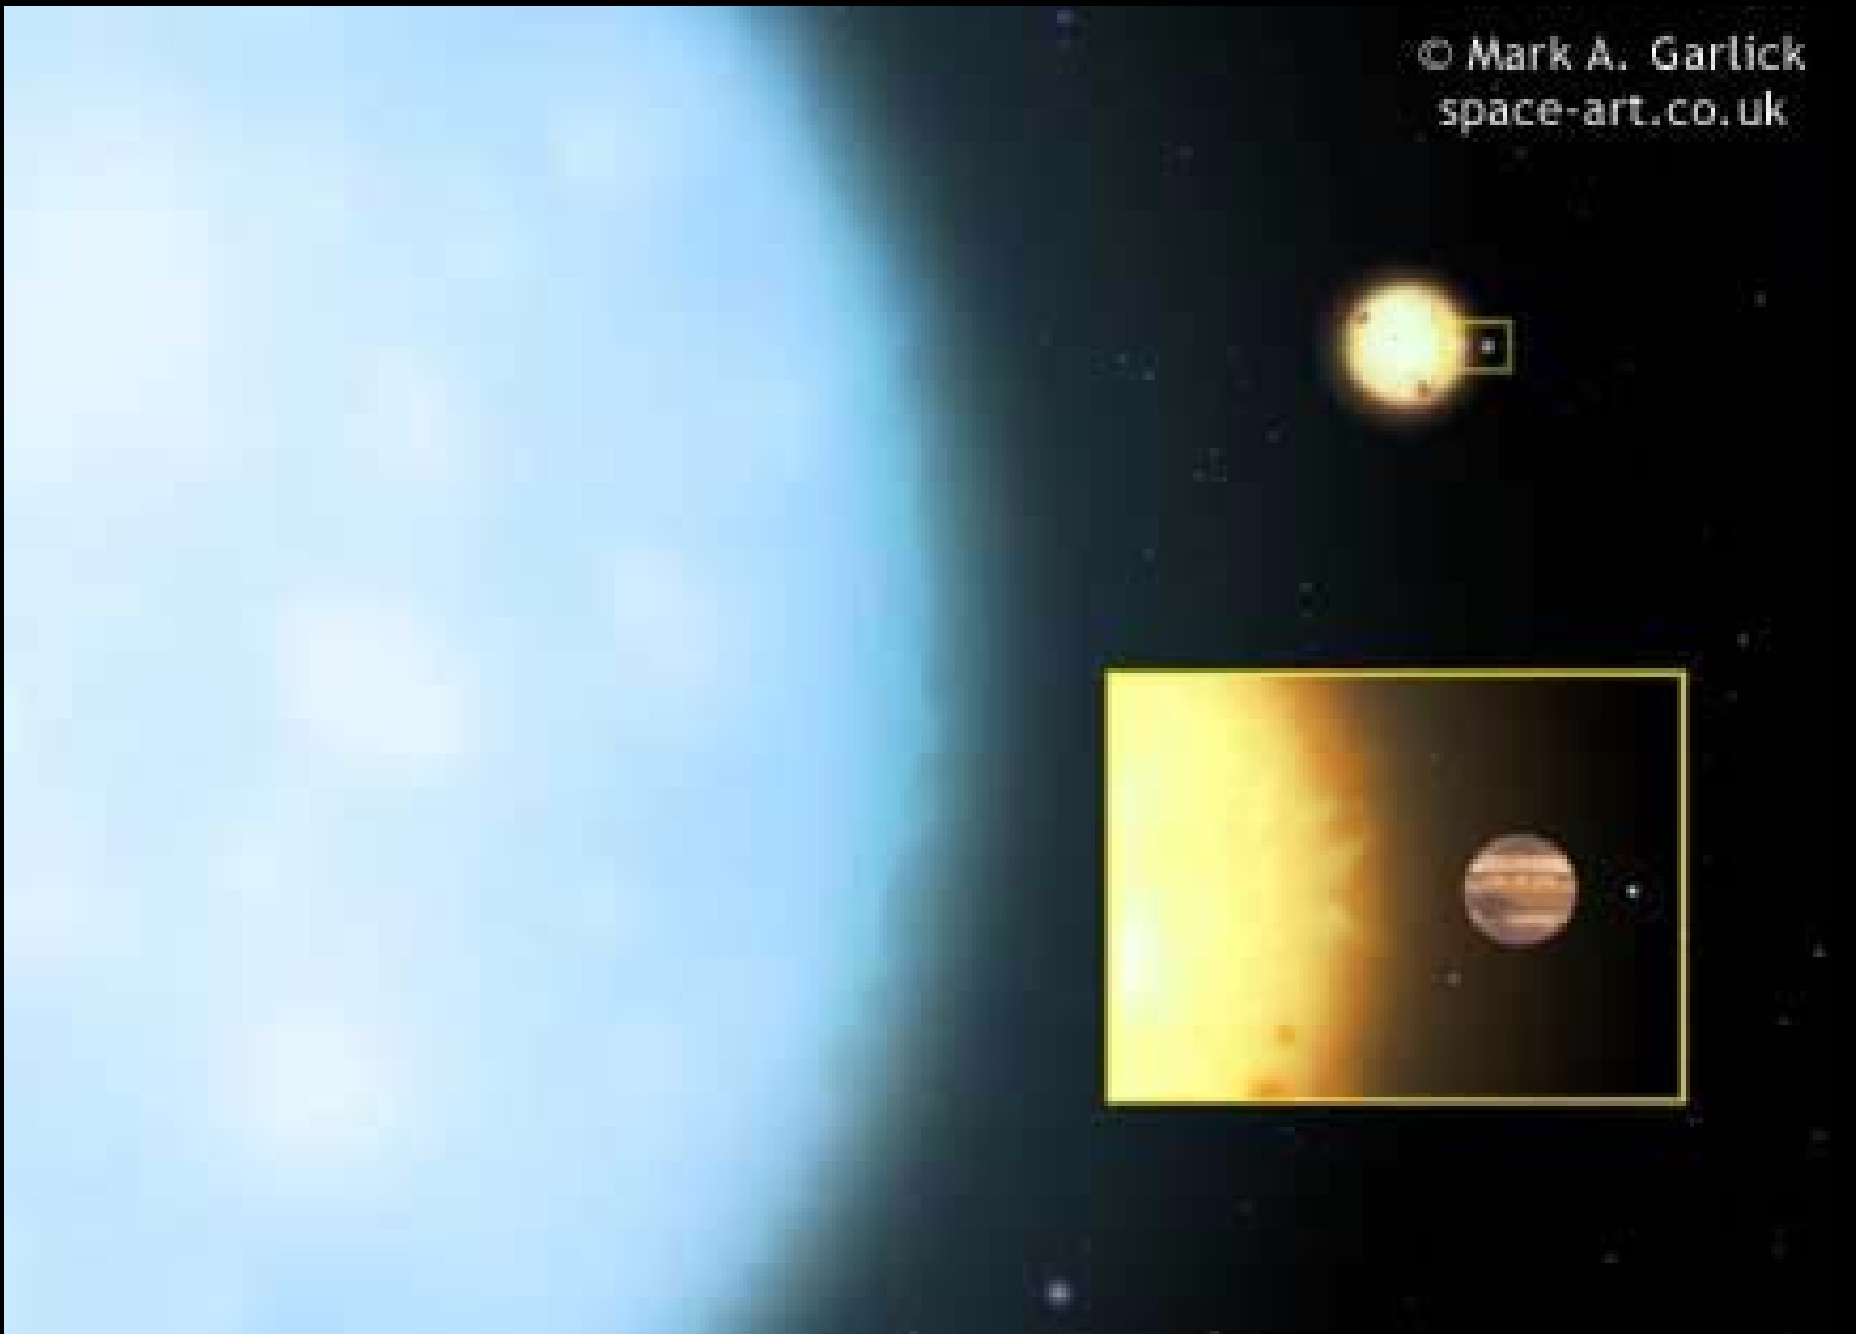

Hotter stars burn their hydrogen much faster, via the **CNO Cycle**

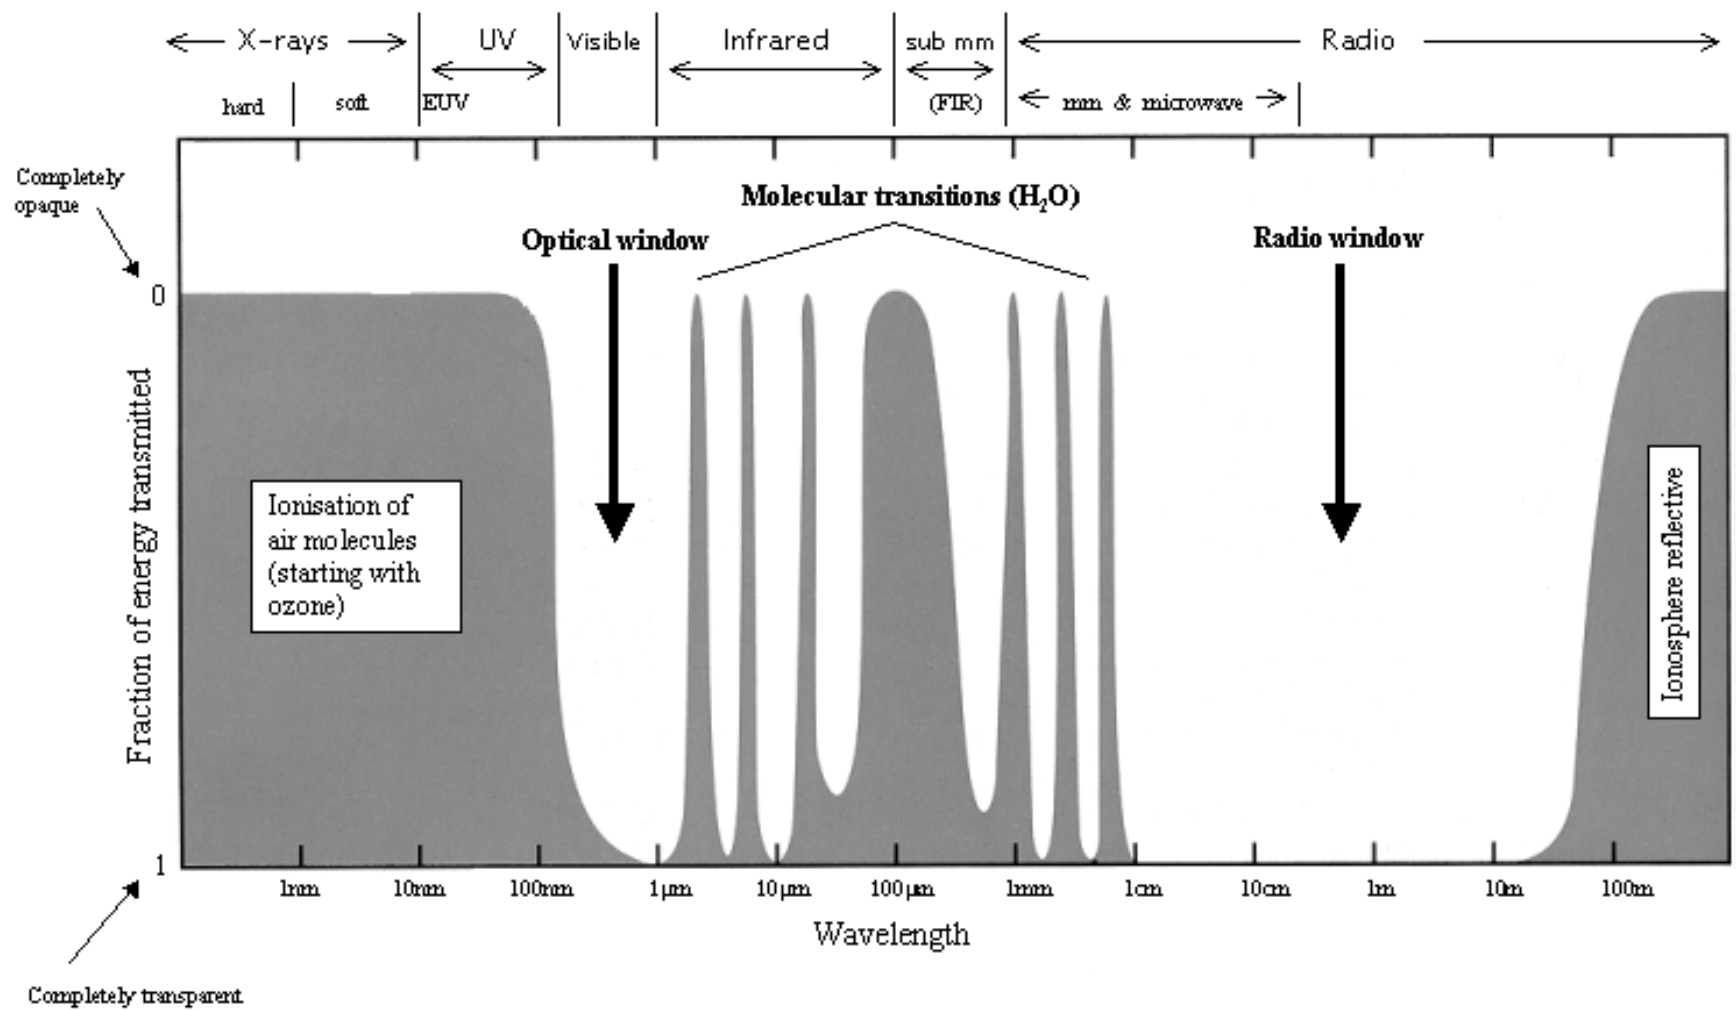

Stars on the **Main Sequence** turn hydrogen into helium.

Blue stars are much hotter than the Sun, and use up their hydrogen in a few million years
