ON THE ELECTRODYNAMICS OF MOVING BODIES

BY A. EINSTEIN

June 30, 1905

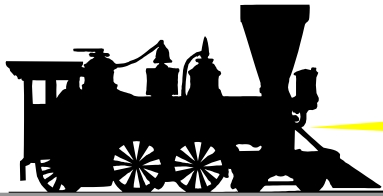

It is known that Maxwell's electrodynamics—as usually understood at the present time—when applied to moving bodies, leads to asymmetries which do not appear to be inherent in the phenomena. Take, for example, the reciprocal electrodynamic action of a magnet and a conductor. The observable phenomenon here depends only on the relative motion of the conductor and the magnet, whereas the customary view draws a sharp distinction between the two cases in which either the one or the other of these bodies is in motion. For if the magnet is in motion and the conductor at rest, there arises in the neighbourhood of the magnet an electric field with a certain definite energy, producing a current at the places where parts of the conductor are situated. But if the magnet is stationary and the conductor in motion, no electric field arises in the neighbourhood of the magnet. In the conductor, however, we find an electromotive force, to which in itself there is no corresponding energy, but which gives rise—assuming equality of relative motion in the two cases discussed—to electric currents of the same path and intensity as those produced by the electric forces in the former case.

Examples of this sort, together with the unsuccessful attempts to discover any motion of the earth relatively to the "light medium," suggest that the phenomena of electrodynamics as well as of mechanics possess no properties corresponding to the idea of absolute rest. They suggest rather that, as has already been shown to the first order of small quantities, the same laws of electrodynamics and optics will be valid for all frames of reference for which the equations of mechanics hold good.¹ We will raise this conjecture (the purport of which will hereafter be called the "Principle of Relativity") to the status of a postulate, and also introduce another postulate, which is only apparently irreconcilable with the former, namely, that light is always propagated in empty space with a definite velocity c which is independent of the state of motion of the emitting body. These two postulates suffice for the attainment of a simple and consistent theory of the electrodynamics of moving bodies based on Maxwell's theory for stationary bodies. The introduction of a "luminiferous ether" will prove to be superfluous inasmuch as the view here to be developed will not require an "absolutely stationary space" provided with special properties, nor

¹The preceding memoir by Lorentz was not at this time known to the author.

Let's call the time measured on the train t_m

The base of this triangle is vt_m

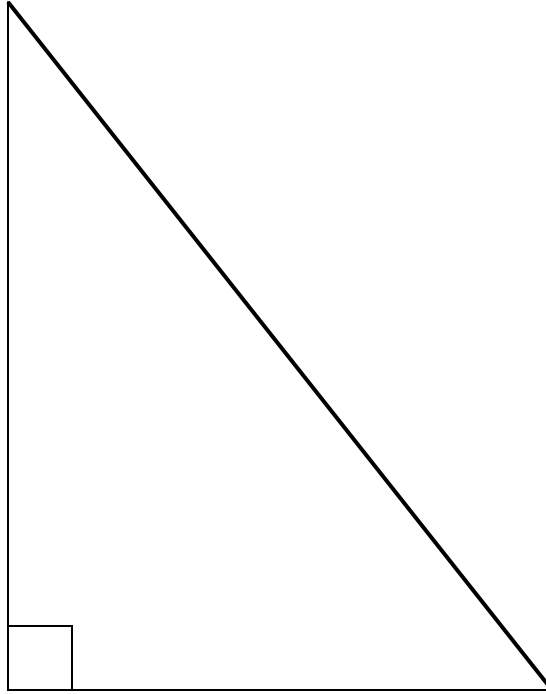

This is an isosceles triangle, so it's made up of two equal right angled triangles

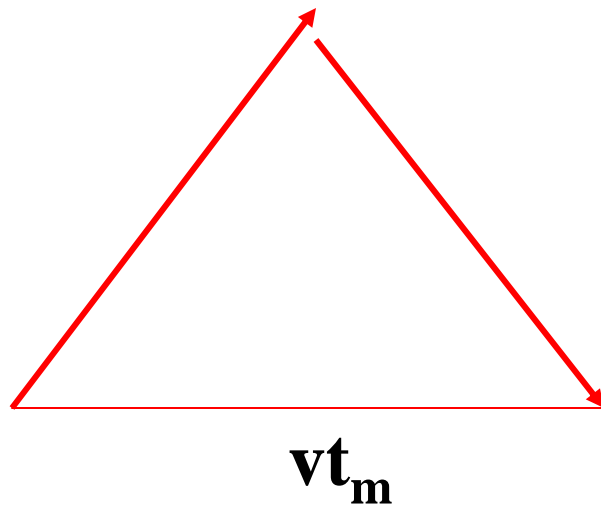

This is an isosceles triangle, so it's made up of two equal right angled triangles

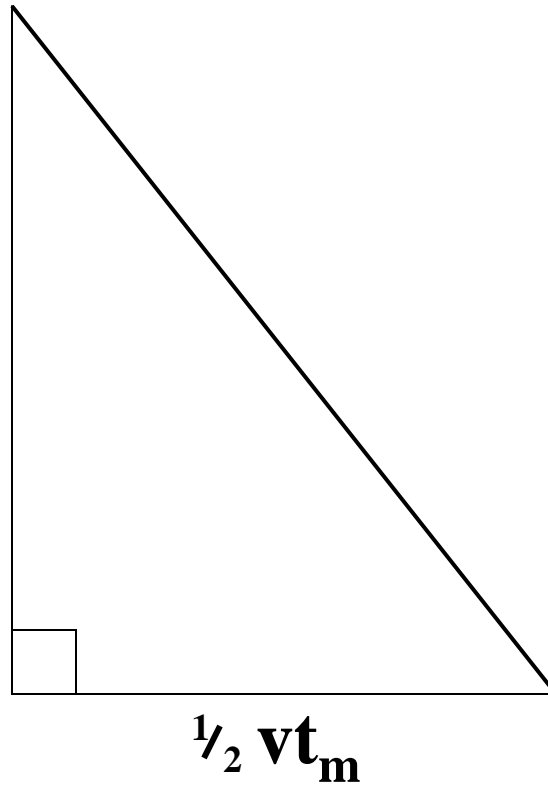

This is an isosceles triangle, so it's made up of two right angled triangles

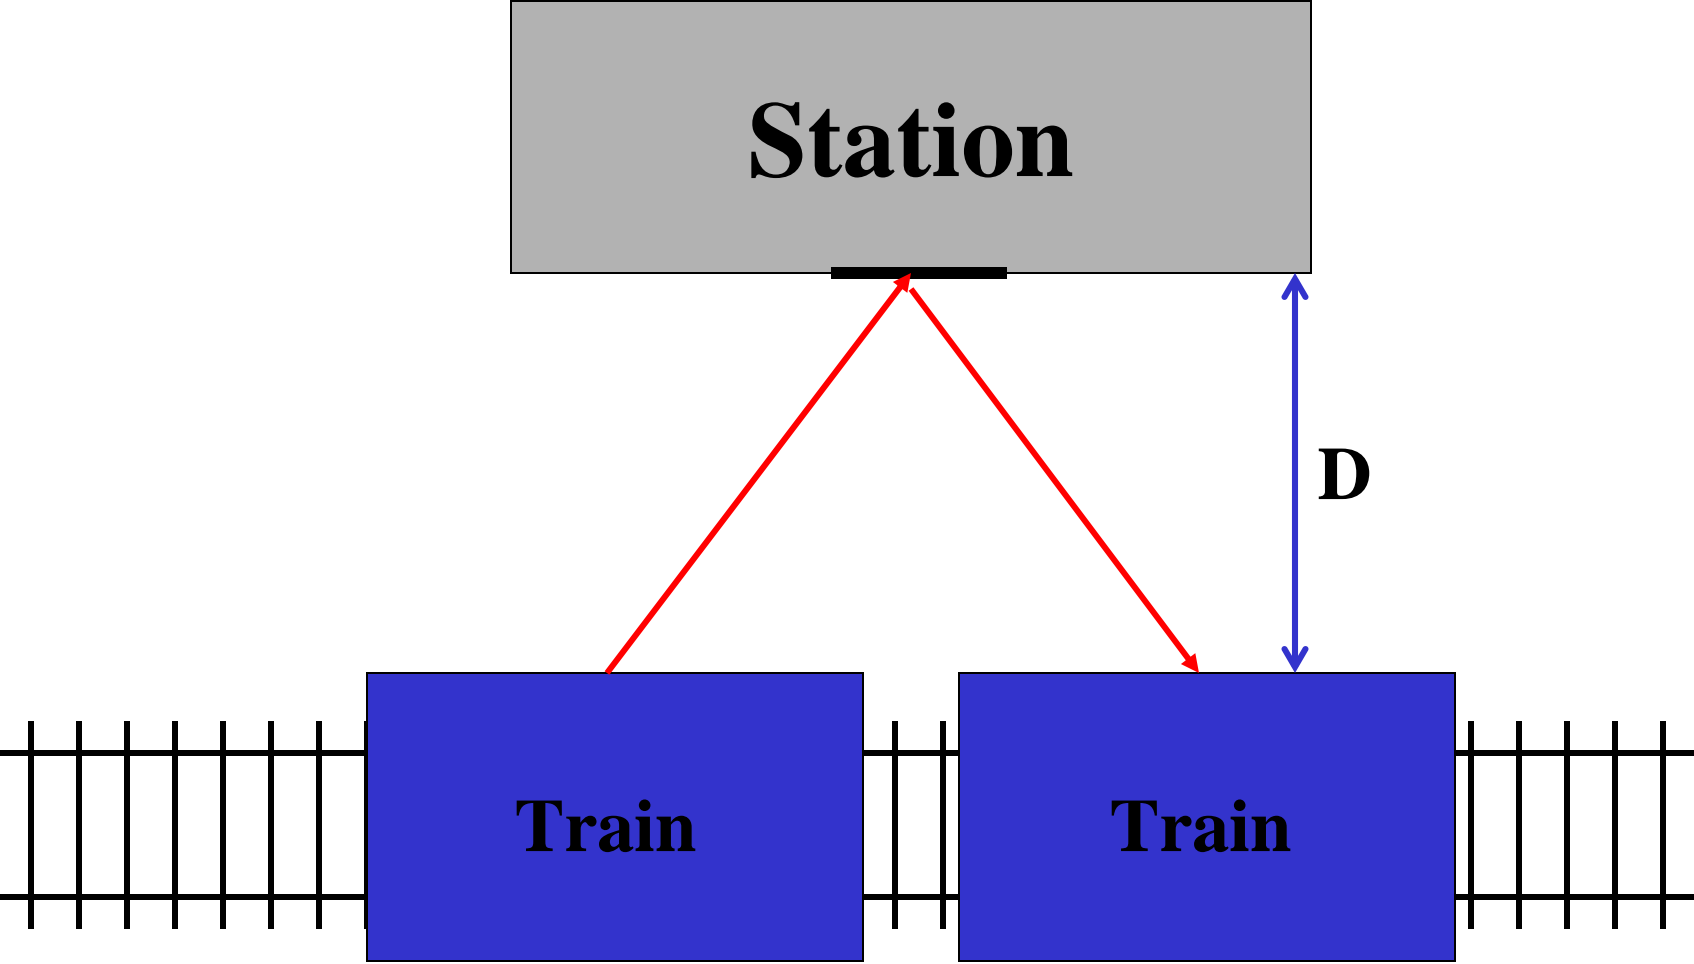

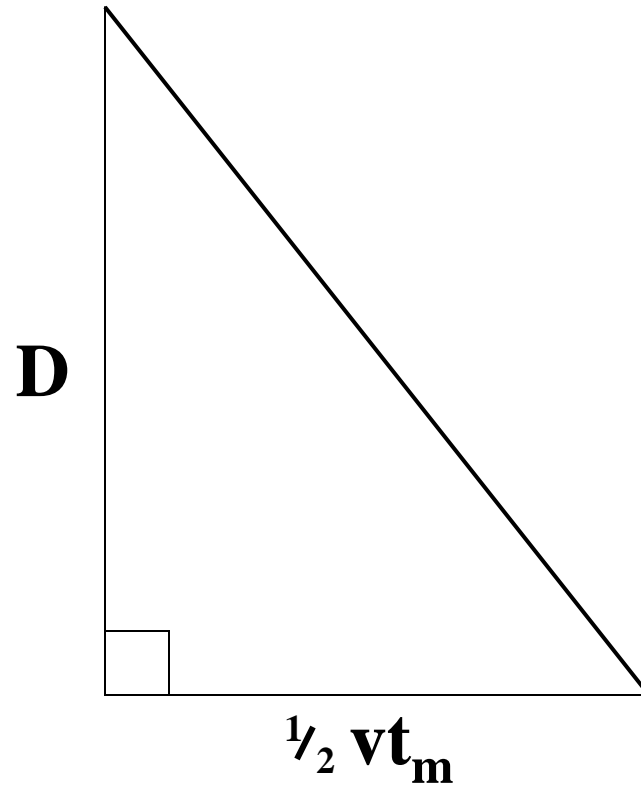

Let's look at this right angled triangle

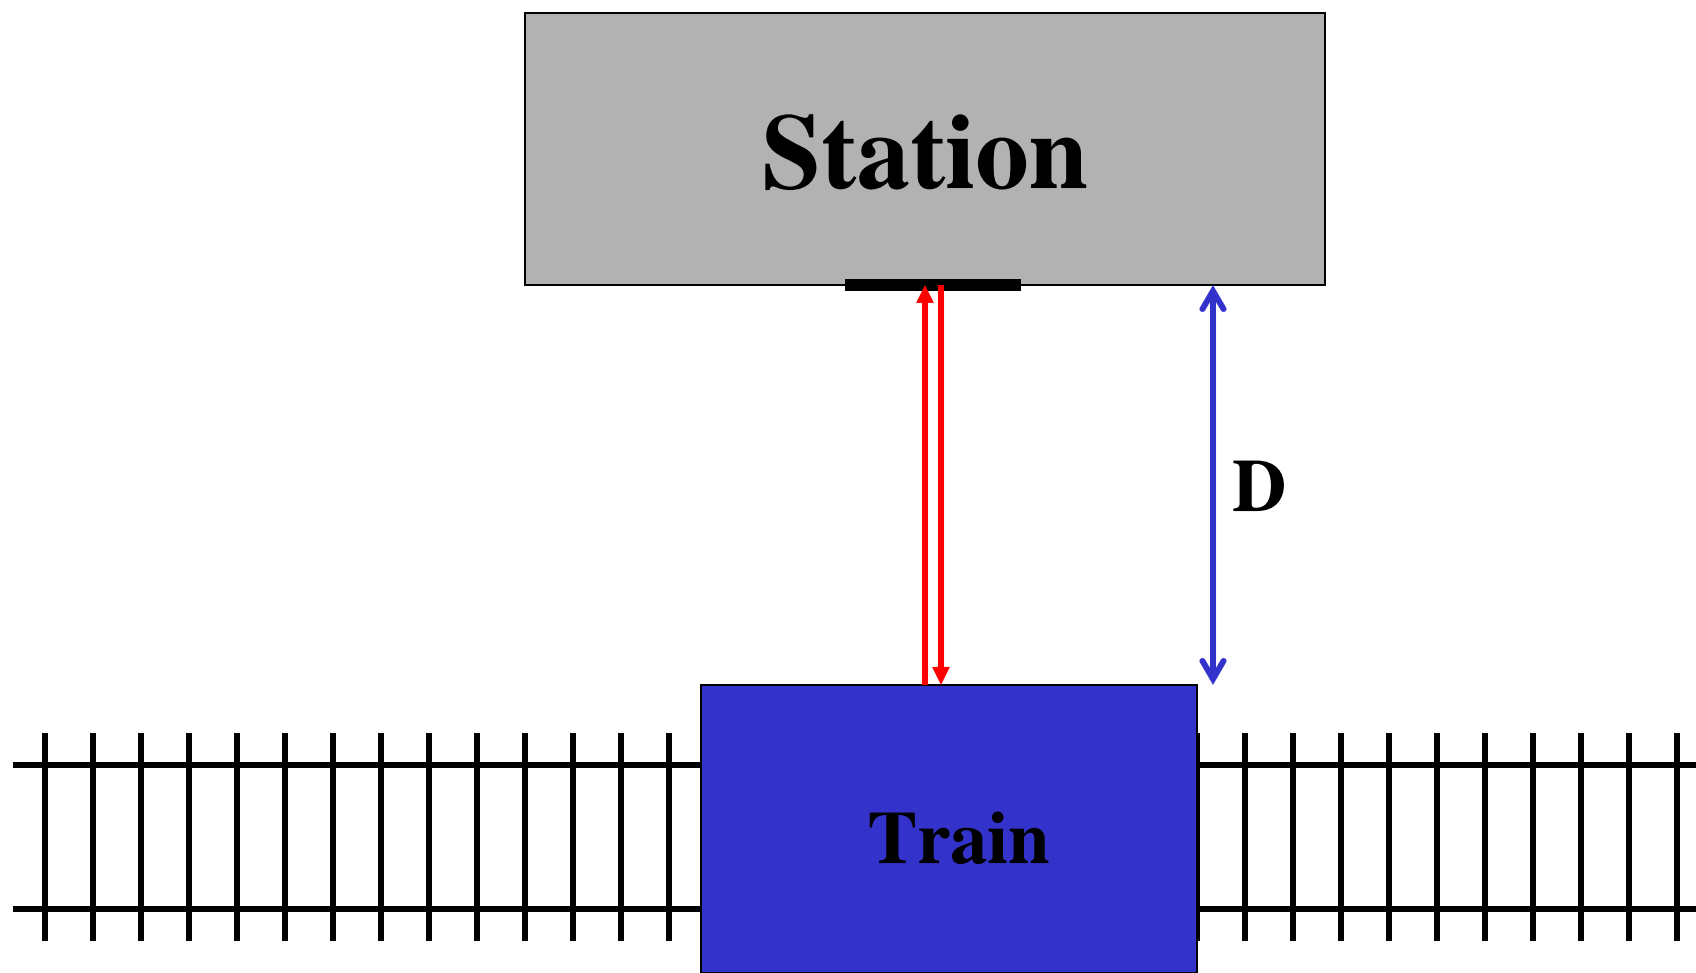

Let's look at this right angled triangle

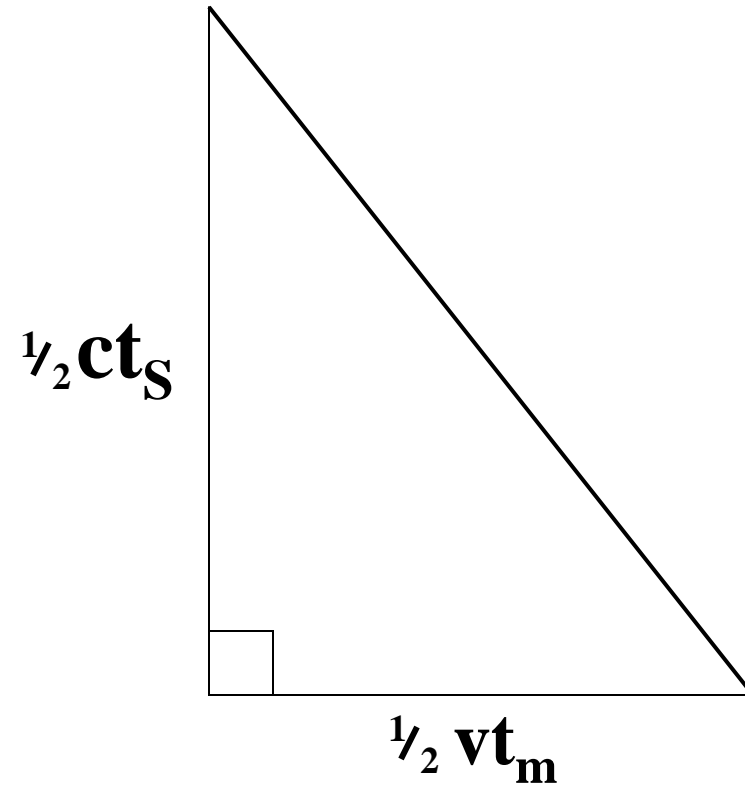

Let's look at this right angled triangle

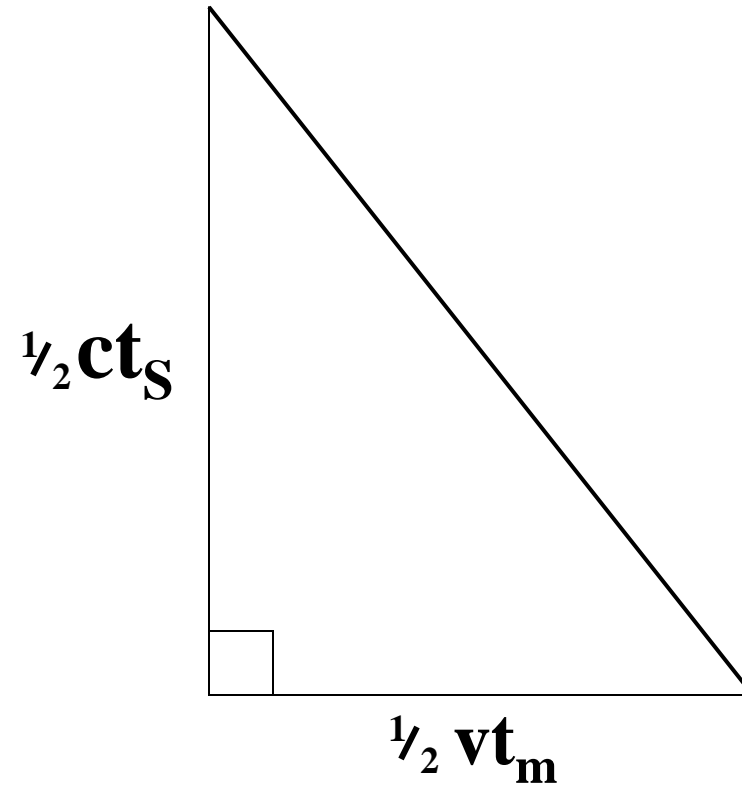

Distance = speed \times time

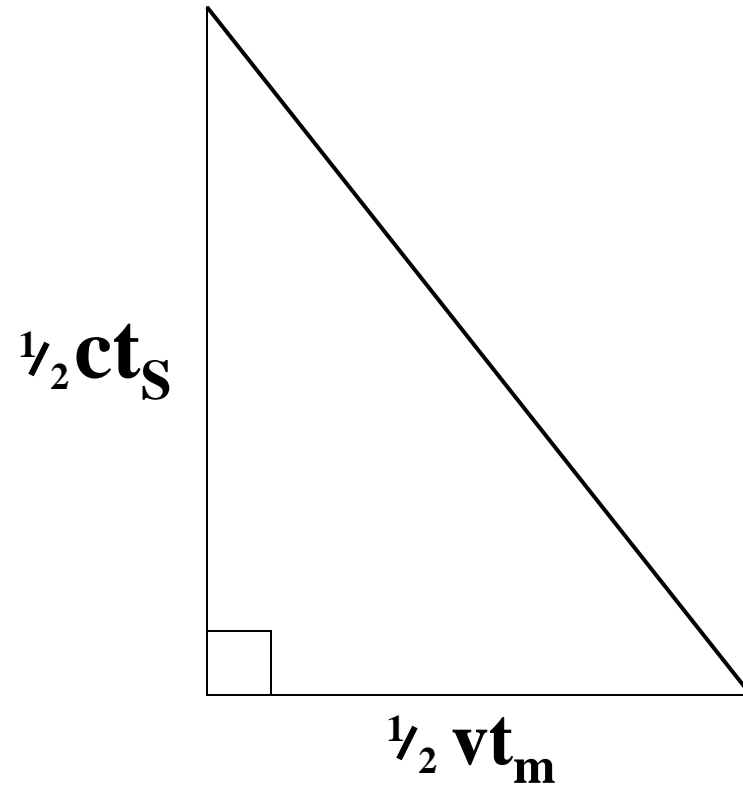

$$2D = ct_s$$

Let's look at this right angled triangle

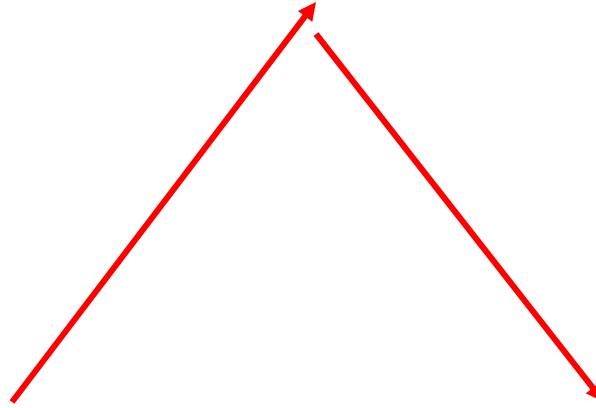

***If* the observer on the moving train
measures the same speed of light, c**

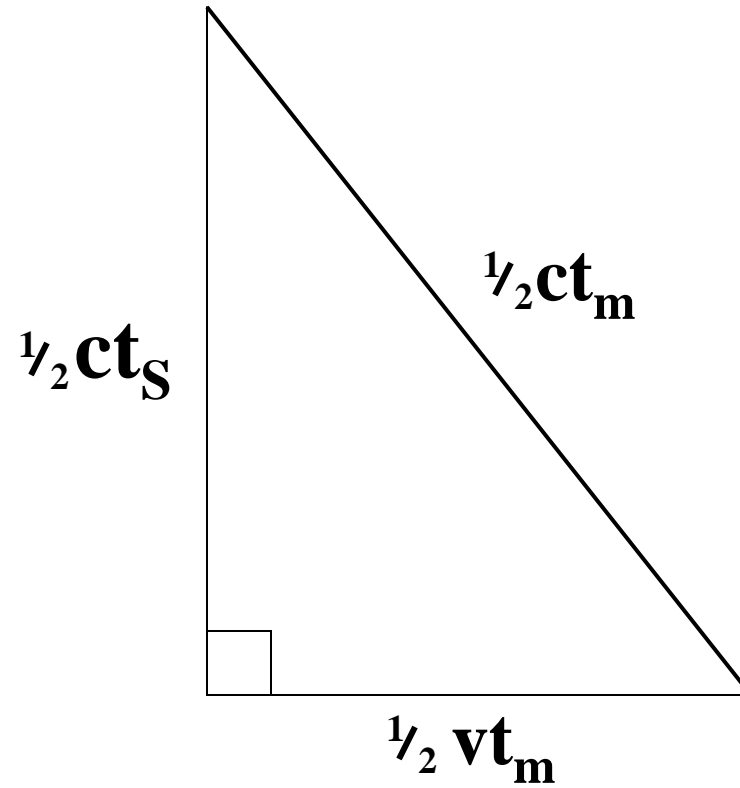

***If* the observer on the moving train
measures the same speed of light, c**

Einstein's big idea!!!

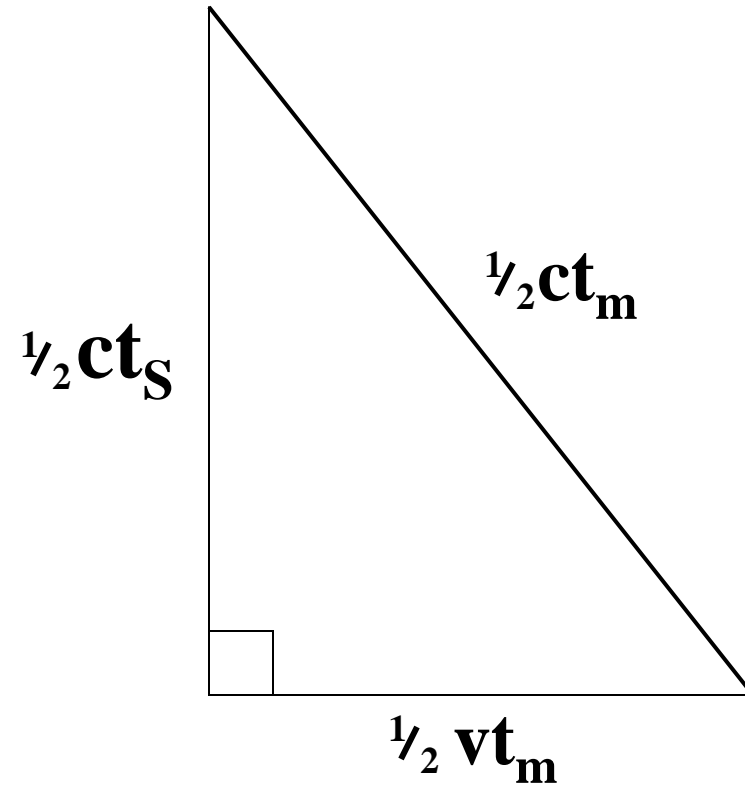

***If* the observer on the moving train
measures the same speed of light, c **

The light travels a total distance ct_m

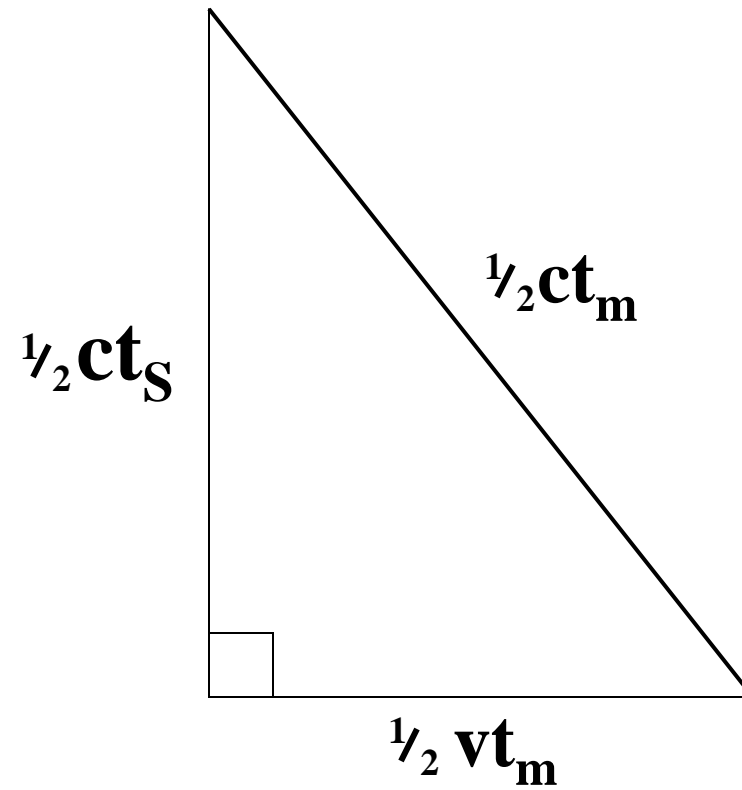

***If* the observer on the moving train measures the same speed of light, c **

The light travels a total distance ct_m

Using Pythagoras' theorem,

$$(ct_m)^2 = (vt_m)^2 + (ct_S)^2$$

Using Pythagoras' theorem,

$$t_S = \sqrt{t_m (1 - v^2/c^2)}$$

It appears that time
is running more slowly
on the moving train!!

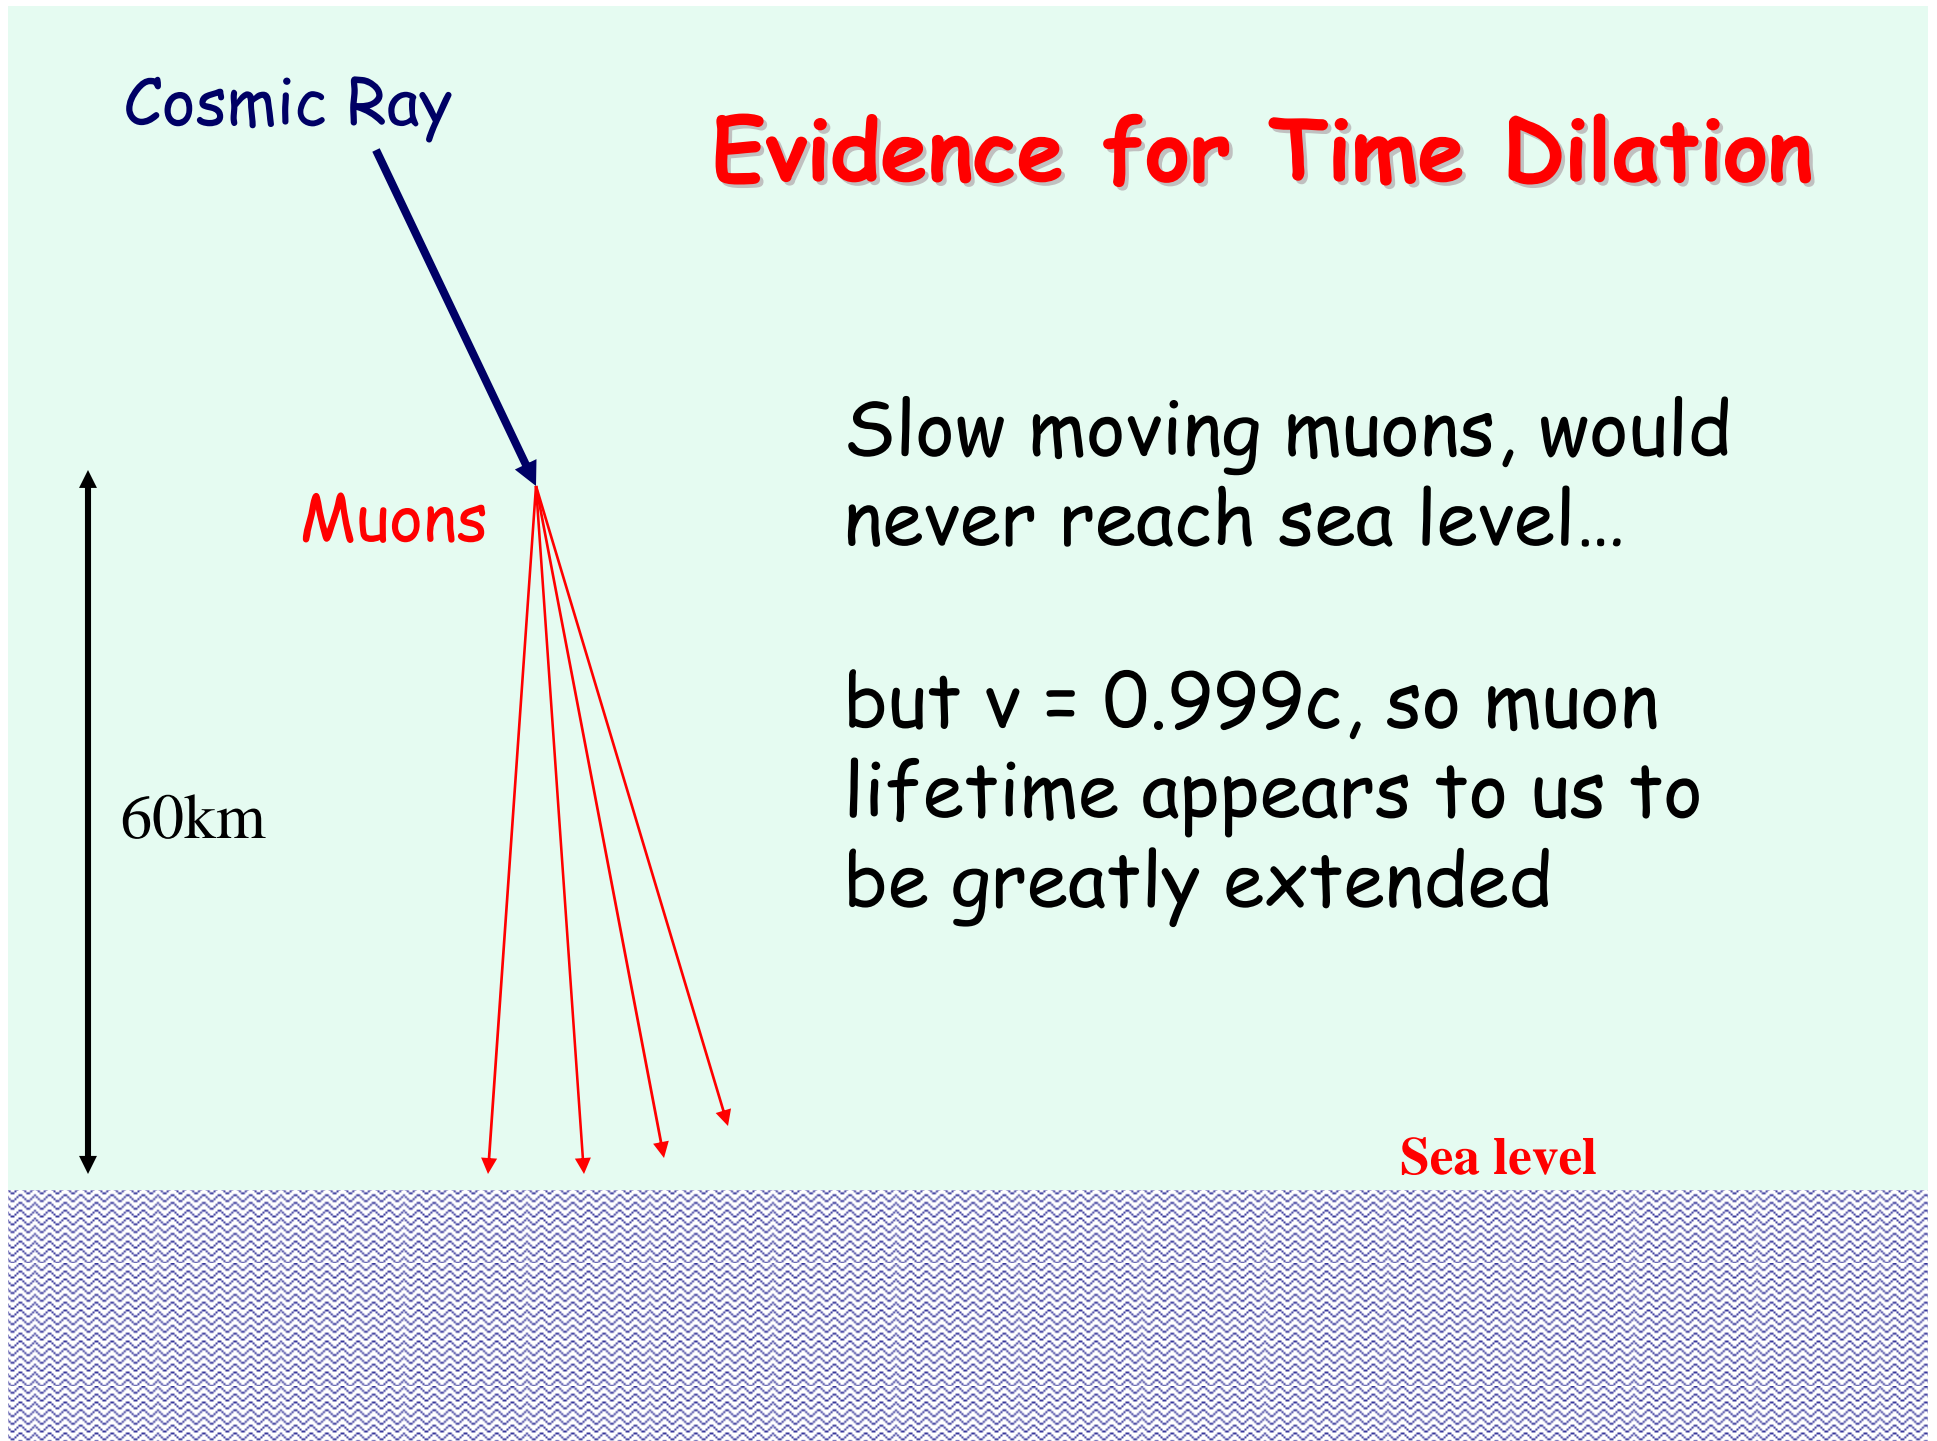

We need to think about
a unified *spacetime*

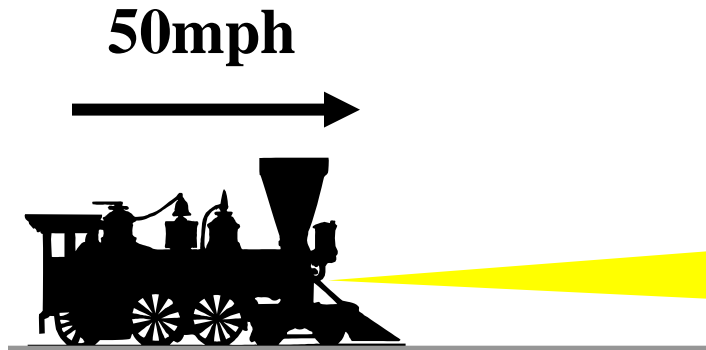

$$t_c = t_p \sqrt{(1 - v^2/c^2)}$$

Evidence for Time Dilation

Slow moving muons, would never reach sea level...

but $v = 0.999c$, so muon lifetime appears to us to be greatly extended

According to Einstein, the speed of light is *unchanged* by the motion of the train

ON THE ELECTRODYNAMICS OF MOVING BODIES

BY A. EINSTEIN

June 30, 1905

It is known that Maxwell's electrodynamics—as usually understood at the present time—when applied to moving bodies, leads to asymmetries which do not appear to be inherent in the phenomena. Take, for example, the reciprocal electrodynamic action of a magnet and a conductor. The observable phenomenon here depends only on the relative motion of the conductor and the magnet, whereas the customary view draws a sharp distinction between the two cases in which either the one or the other of these bodies is in motion. For if the magnet is in motion and the conductor at rest, there arises in the neighbourhood of the magnet an electric field with a certain definite energy, producing a current at the places where parts of the conductor are situated. But if the magnet is stationary and the conductor in motion, no electric field arises in the neighbourhood of the magnet. In the conductor, however, we find an electromotive force, to which in itself there is no corresponding energy, but which gives rise—assuming equality of relative motion in the two cases discussed—to electric currents of the same path and intensity as those produced by the electric forces in the former case.

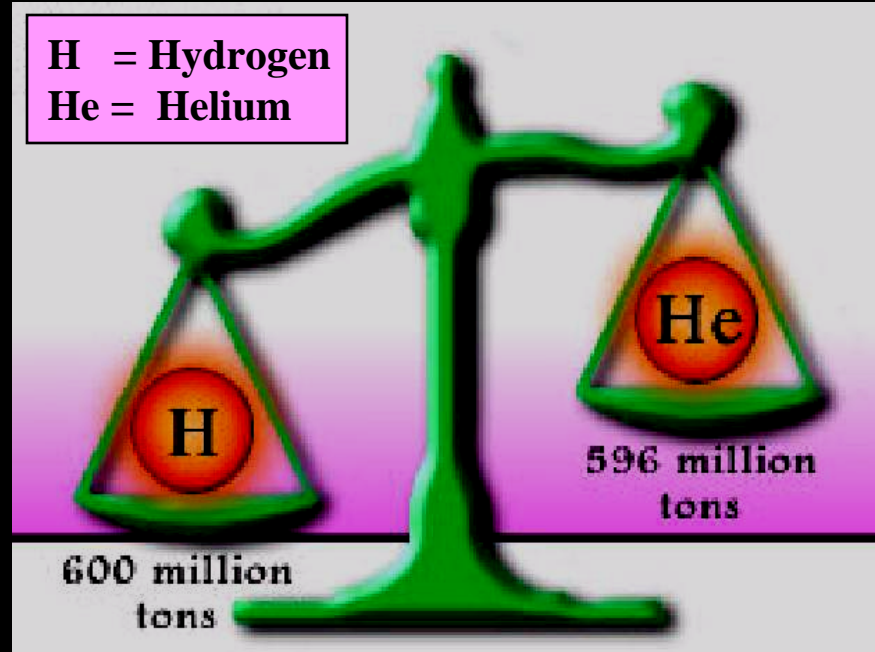

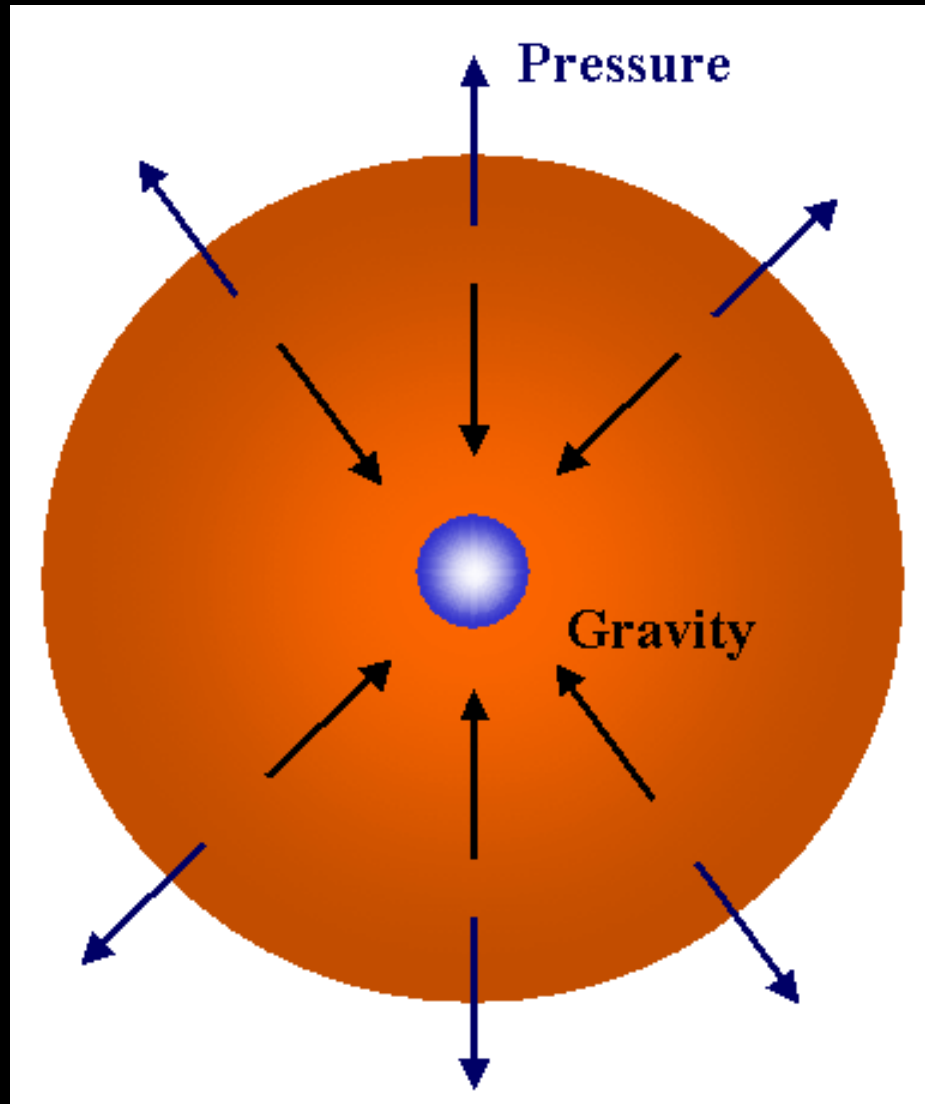

Examples of this sort, together with the unsuccessful attempts to discover any motion of the earth relatively to the "light medium," suggest that the phenomena of electrodynamics as well as of mechanics possess no properties corresponding to the idea of absolute rest. Hydrogen fusion – fuelling a star's nuclear furnace

$$E = mc^2$$

Einstein's Relativity

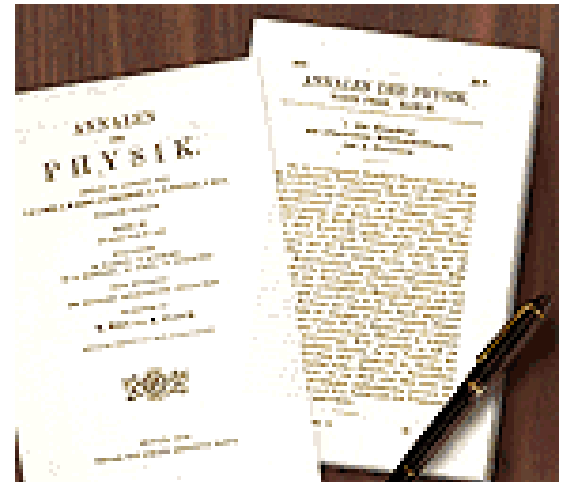

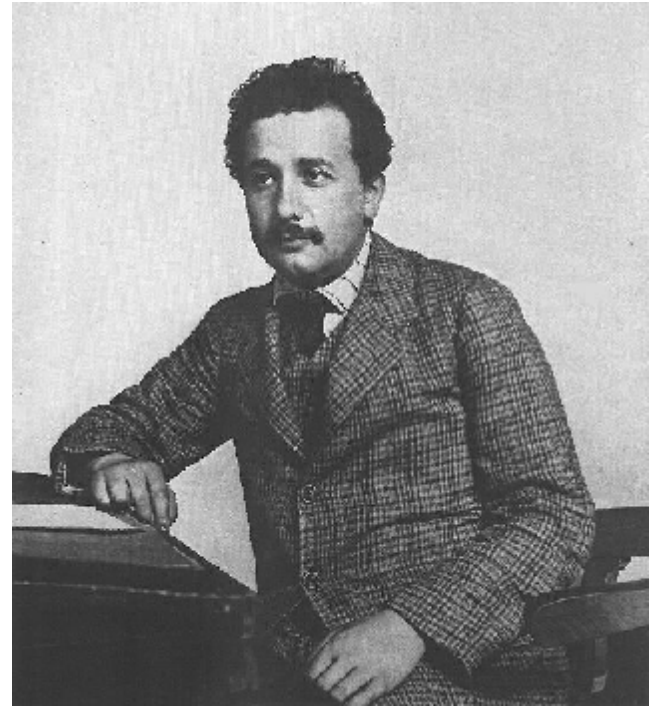

The speed of light is the
ultimate speed limit in
the Universe

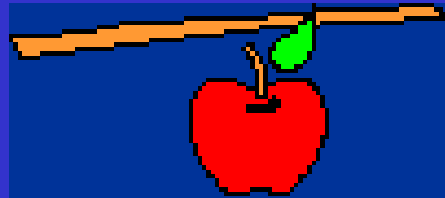

Einstein's Relativity

What about
accelerated
observers?

How does gravity
fit into this?

General Relativity: 1916

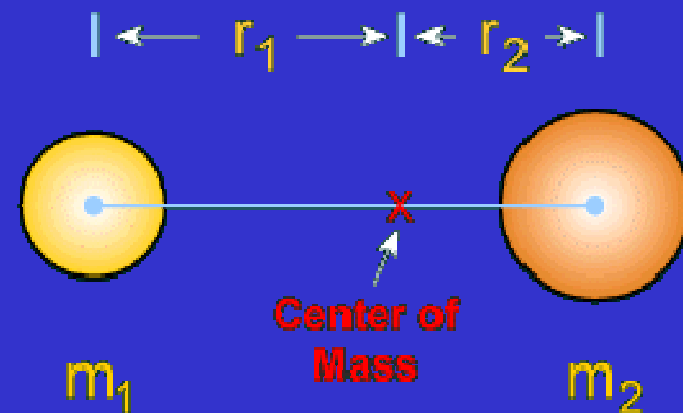

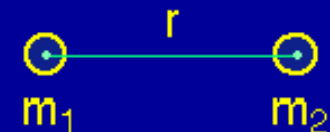

Isaac Newton:
1642 – 1727 AD

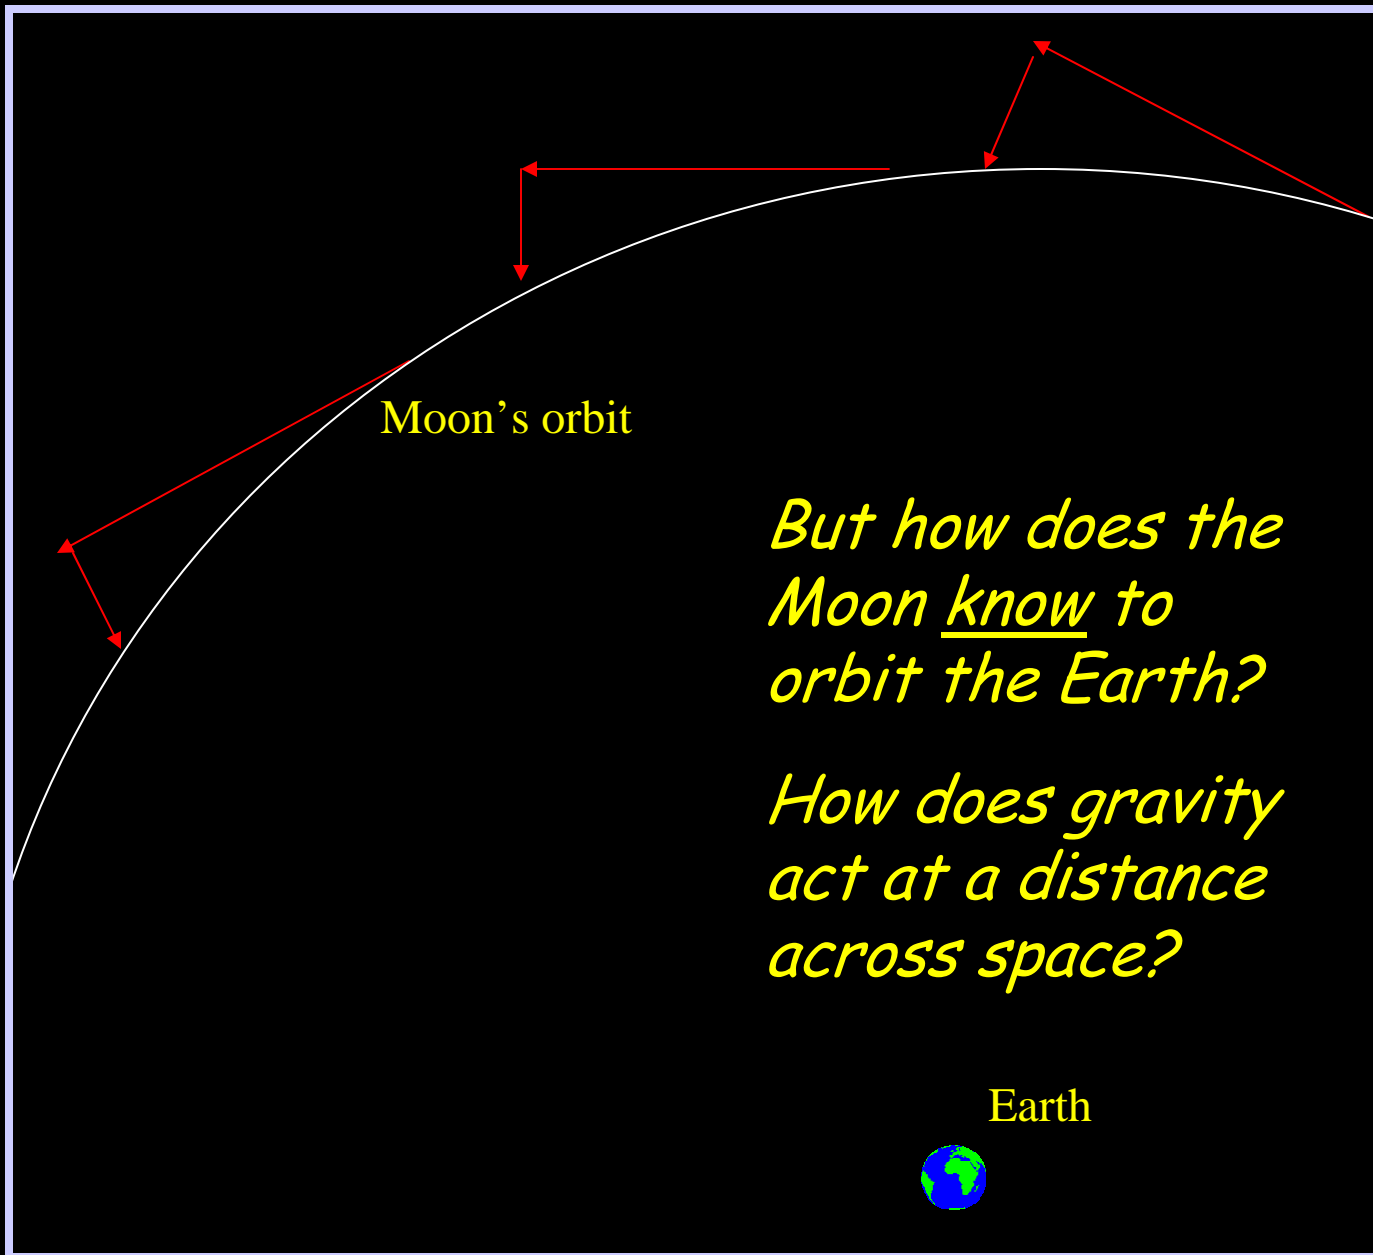

The Principia: 1684 - 1686

Law of Universal Gravitation

Every object in the Universe attracts every other object with a force directed along the line of centers for the two objects that is proportional to the product of their masses and inversely proportional to the square of the separation between the two objects.

$$F_g = G \frac{m_1 m_2}{r^2}$$

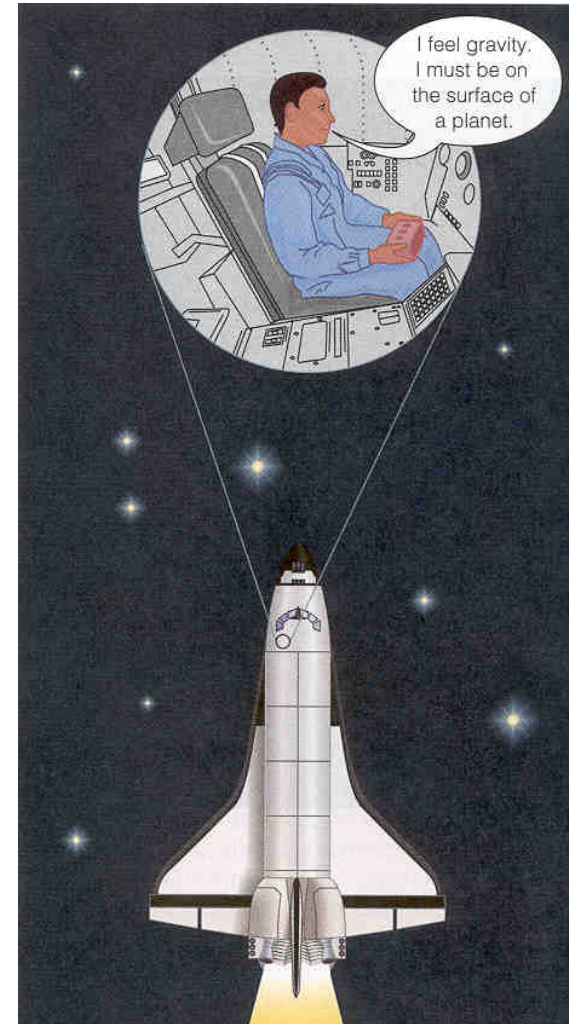

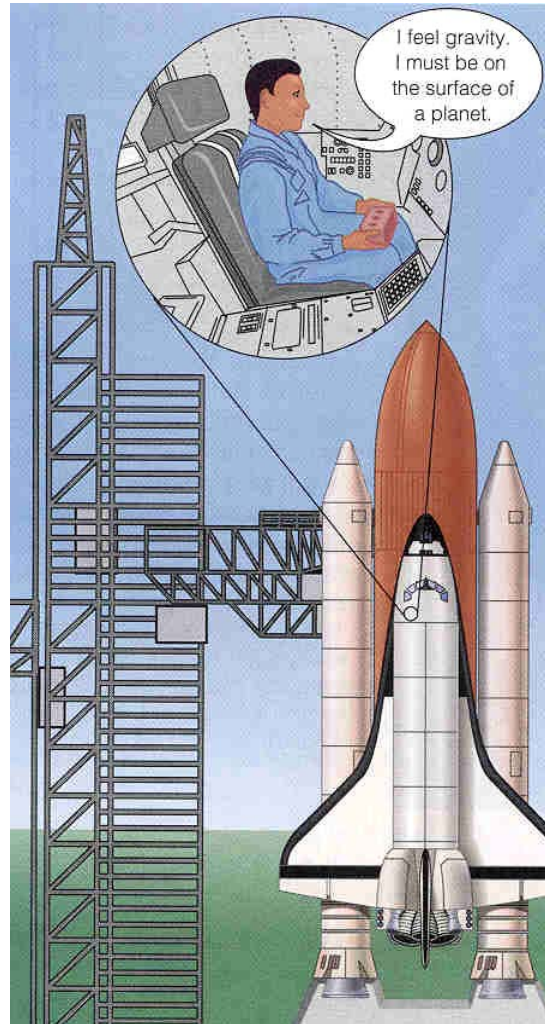

Gravity in Einstein's Universe

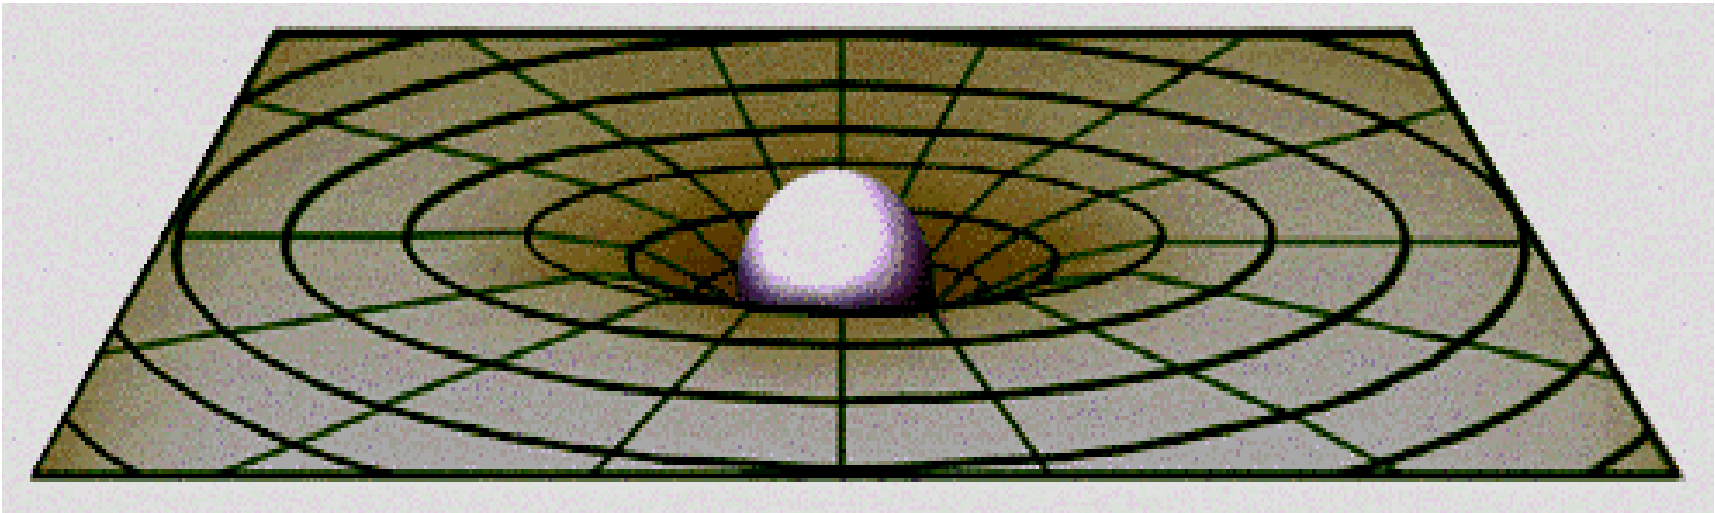

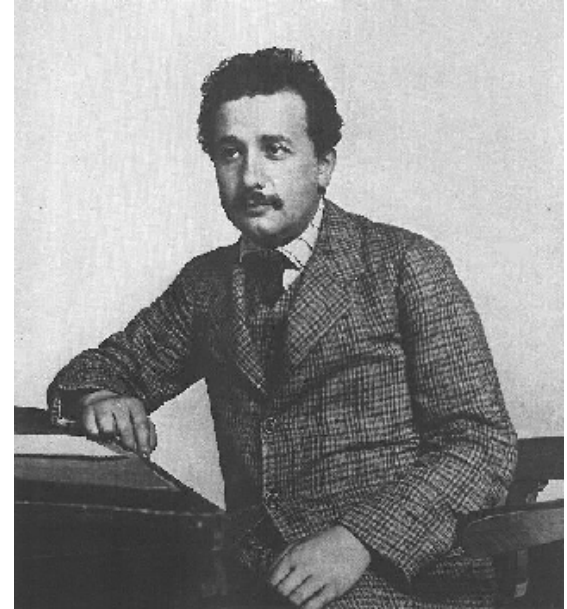

Gravity and acceleration are *equivalent*

Gravity is not a force acting *through* space and time, but the result of mass (and energy) warping spacetime itself

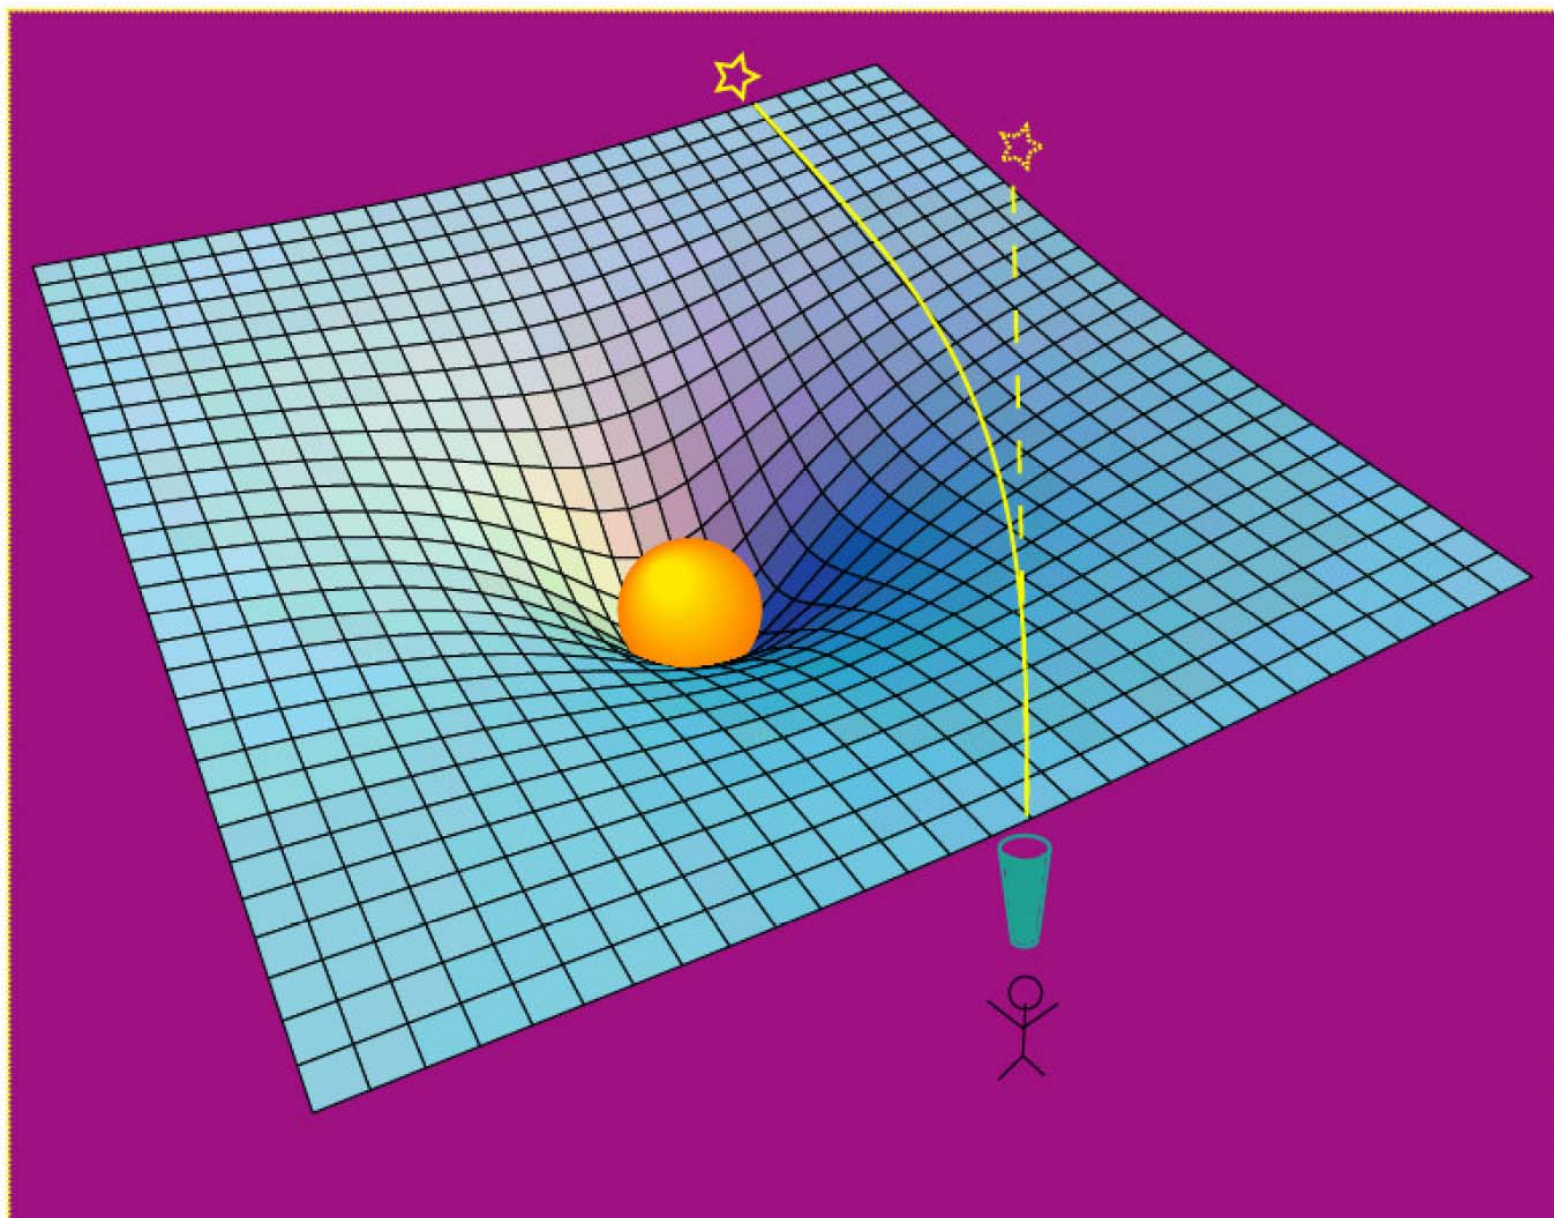

Gravity in Einstein's Universe

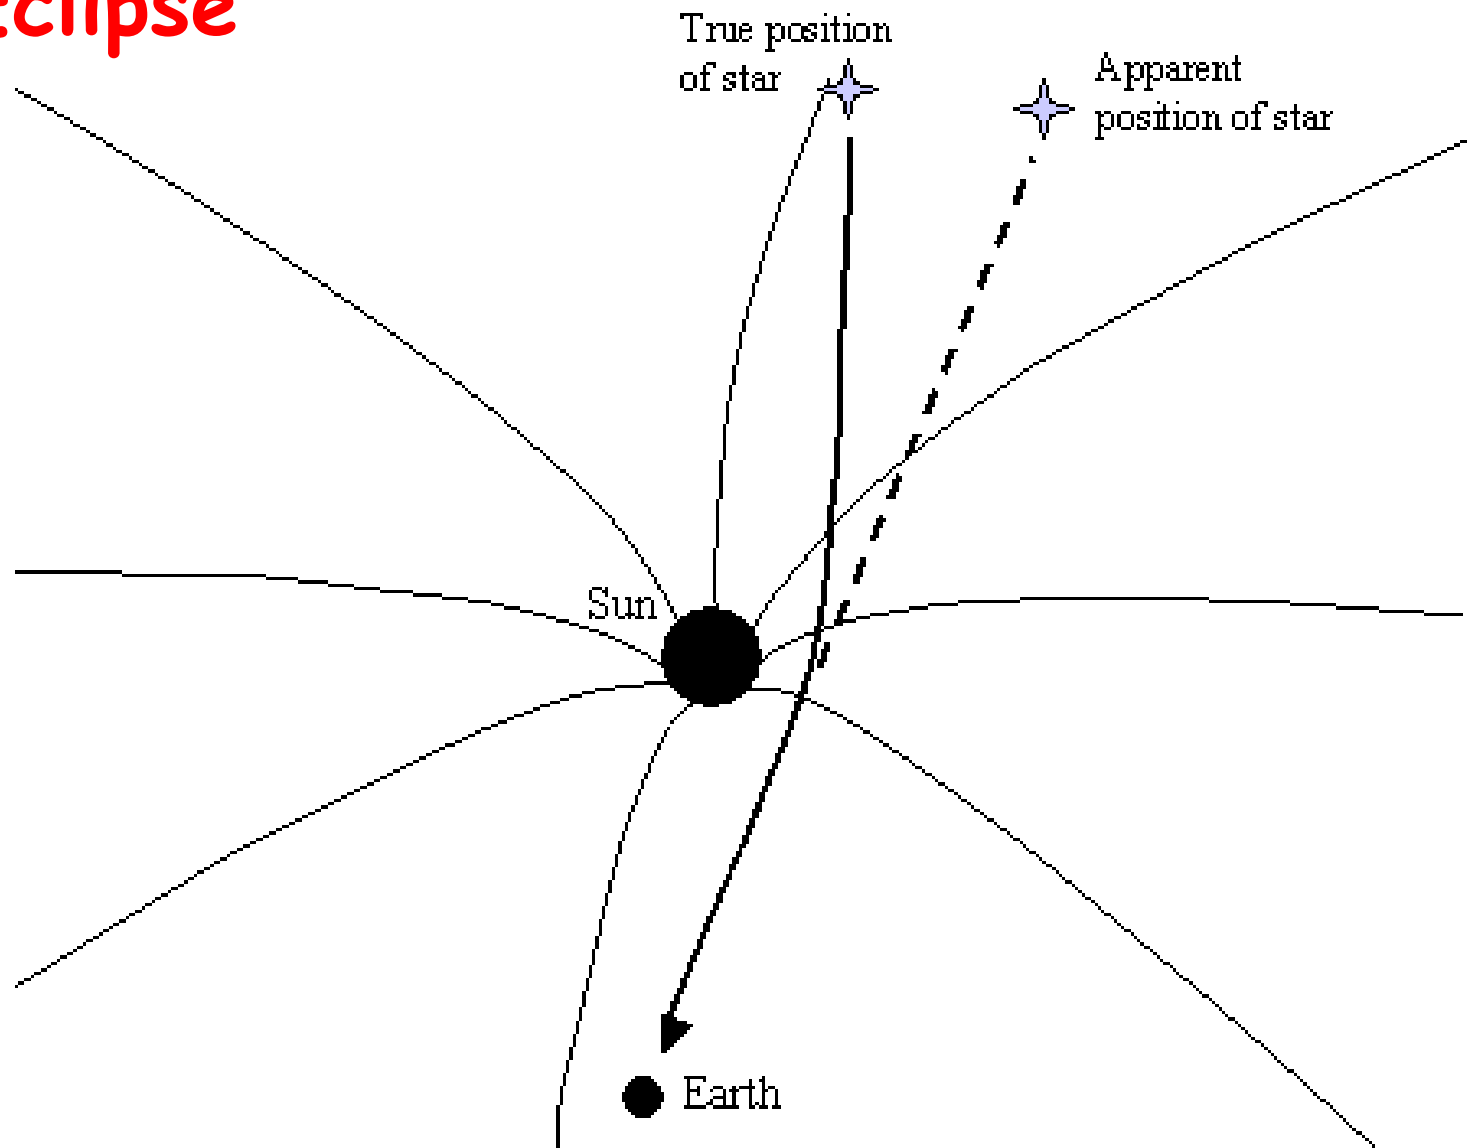

"Spacetime tells matter
how to move, and
matter tells spacetime
how to curve"

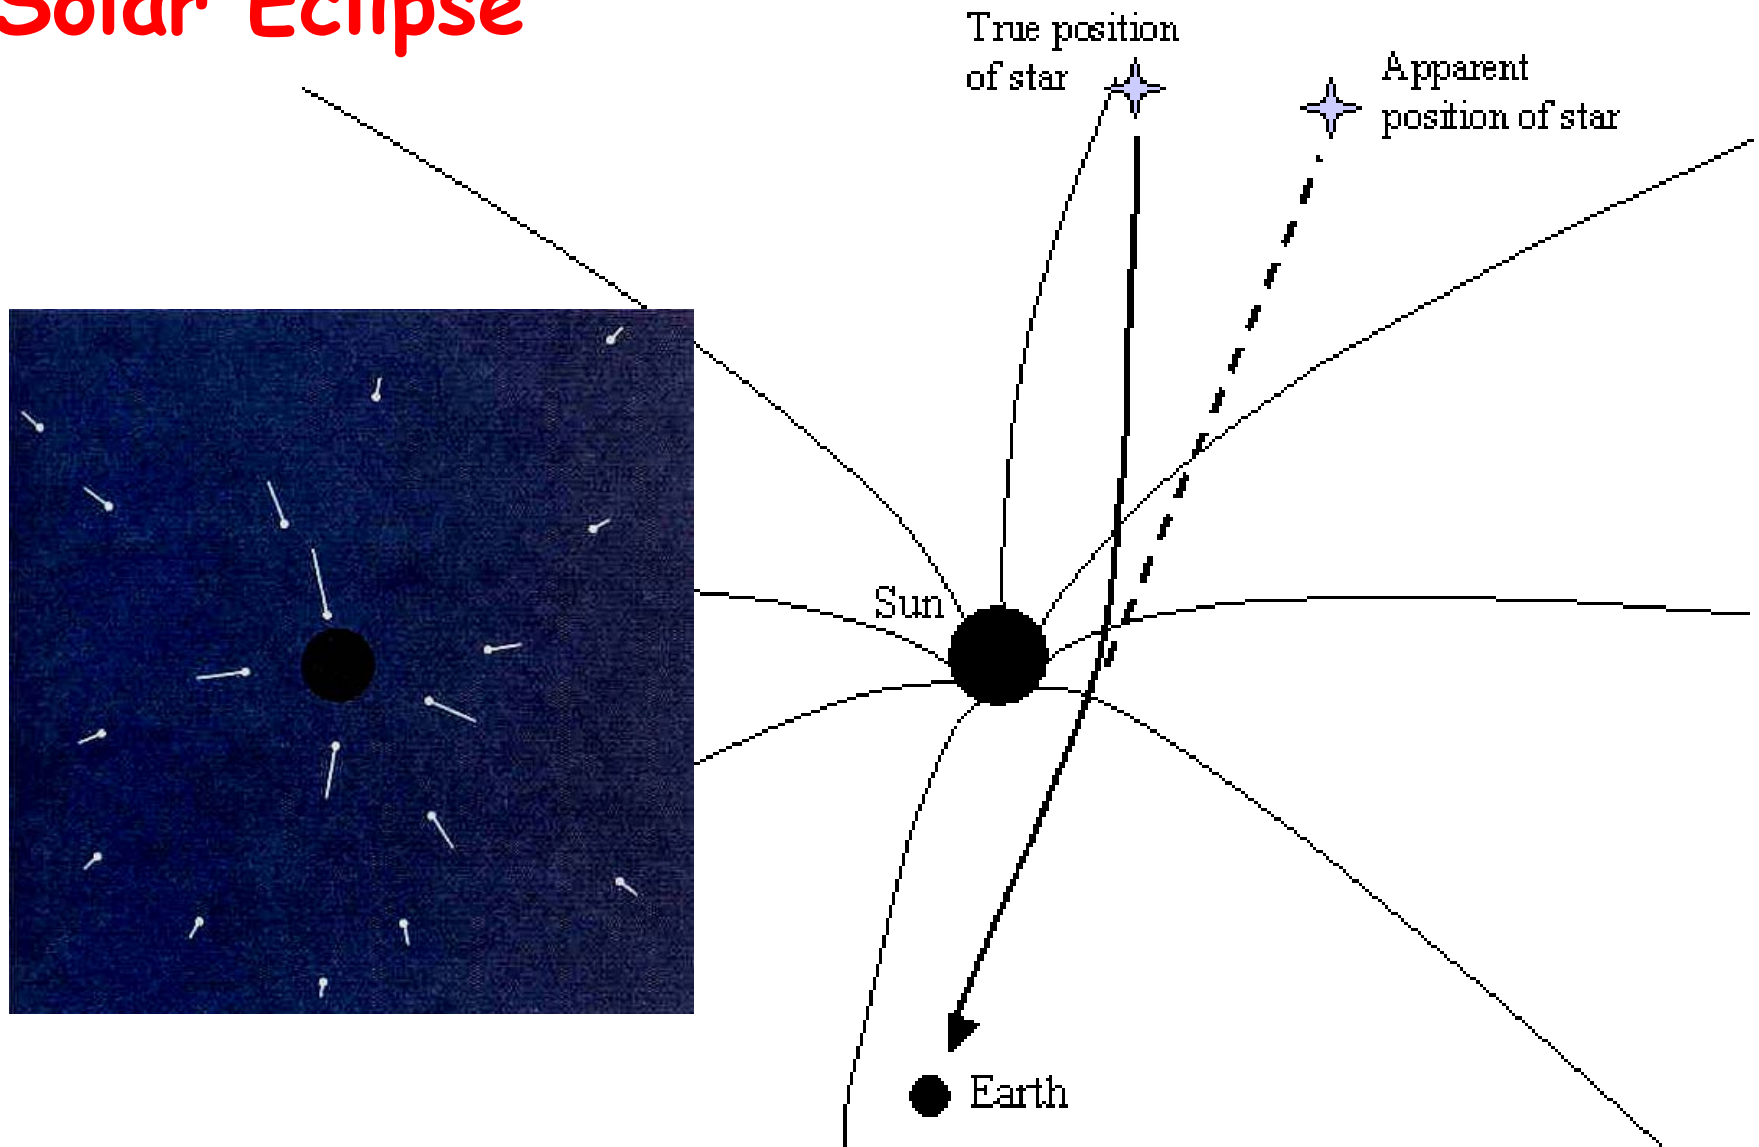

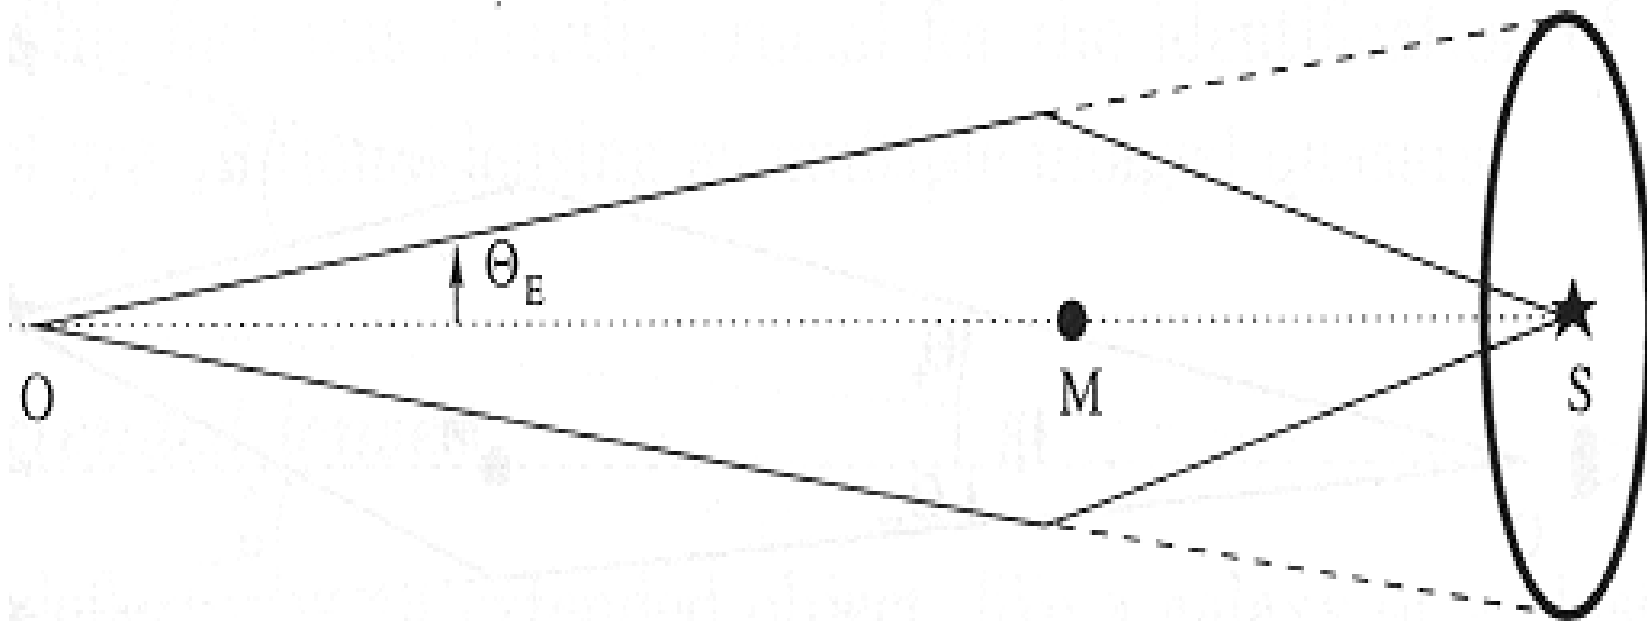

We can see gravitational lensing during a Solar Eclipse

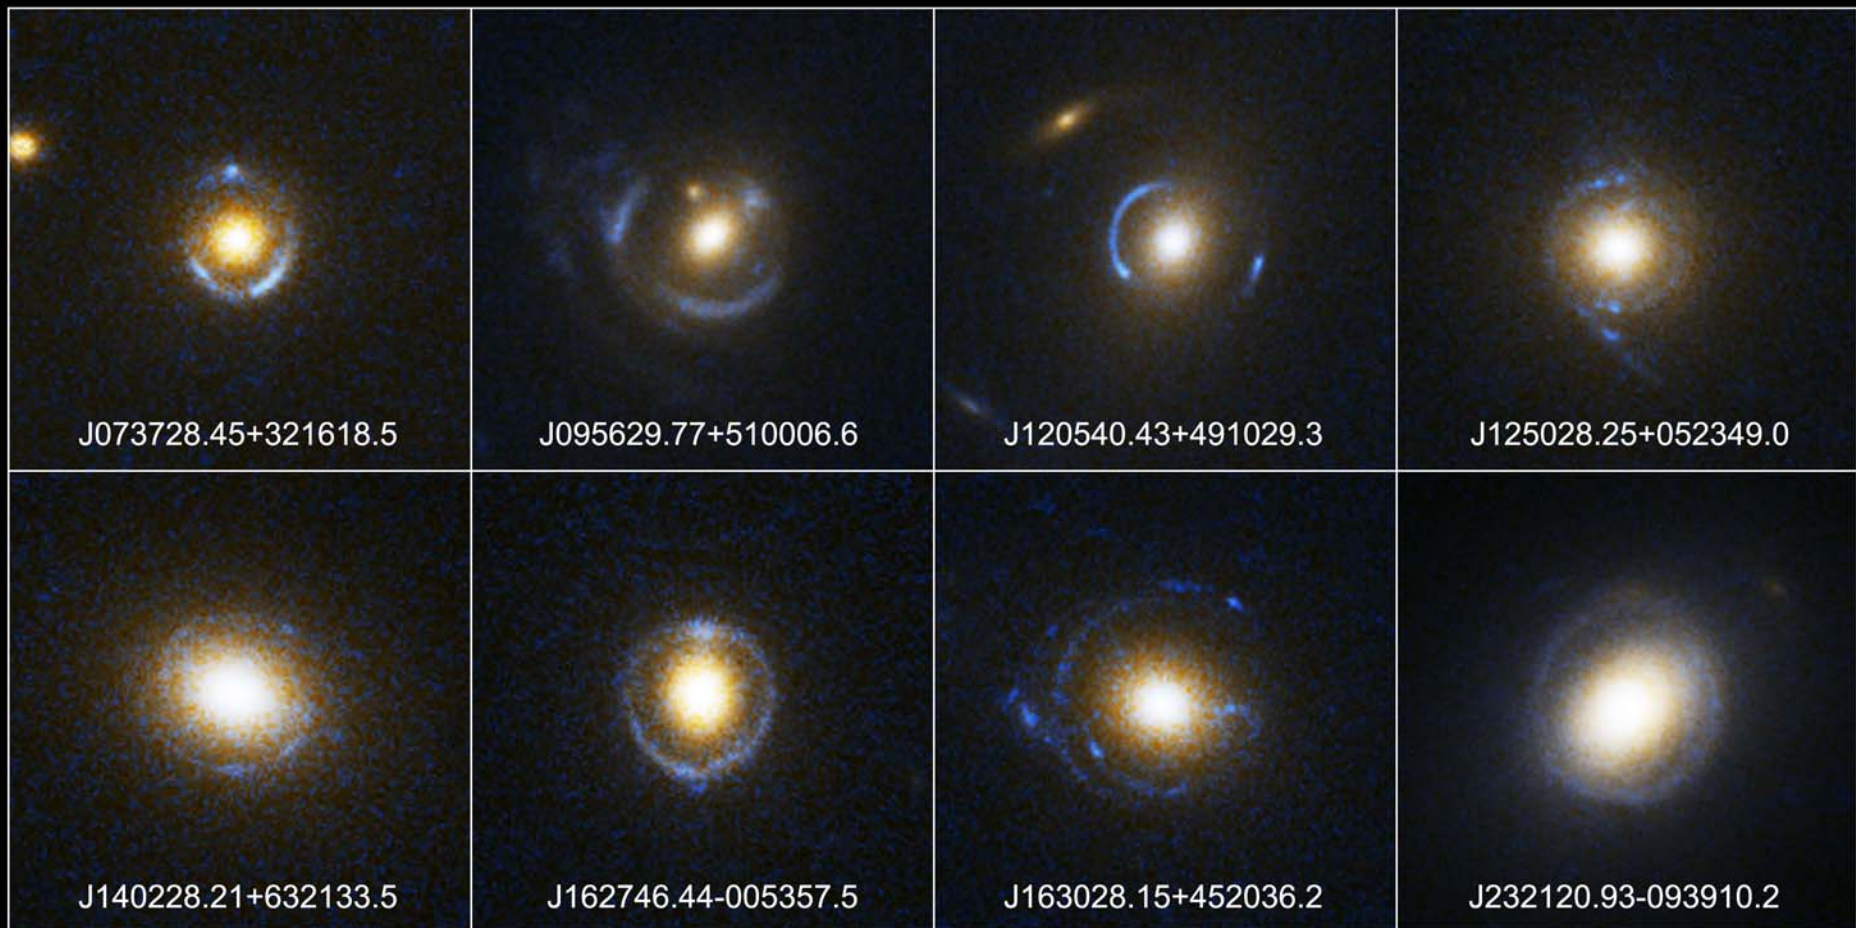

We can see gravitational lensing during a Solar Eclipse

Flat

A deep space photograph showing a vast field of galaxies and stars against a black background. The galaxies are of various shapes and sizes, some appearing as bright, elongated streaks and others as more compact, distant points of light. The stars are scattered throughout, with some appearing as sharp points and others as soft, glowing clouds. The overall scene conveys the immense scale and complexity of the universe.

What have we found?

The shape of the Universe is FLAT

**The Universe will continue to expand
